It protects the Bones and Sinews of the Foot against the Wear and Tear of action, as a lubricant protects Metal moving parts, while providing the wonderful "Barefoot" *hold* on *slippery* surfaces.

◆ ◆ ◆

CONSIDER now the means by which *Tires* have been given maximum Traction,—*i. e.*, by means of a "sandpapery" texture in the Rubber of their Anti-Skid Treads.

Assuredly such Tires *do* give Traction.

But, every time the Brakes are put on, to make *such* Tires grip the road, the relatively hard, unyielding, and comparatively brittle, texture of the Rubber in their Treads causes these Treads to *grind away* on the pavement, to WEAR OUT fast at the point of contact.

The *sudden* efficiency of their *grinding-Traction* also tugs so sharply on the Rubber Adhesive between the layers of Fabric in Tire as to separate these layers.

There is little "give" to them—just as there is little "*slide*" to them.

So, they gain Traction at the expense of *Mileage.*

Naturally such Tires require *a great BULK of such Rubber* in order to deliver reasonable Mileage before worn out.

And, therein they differ radically from GOODRICH "Barefoot" Tires.

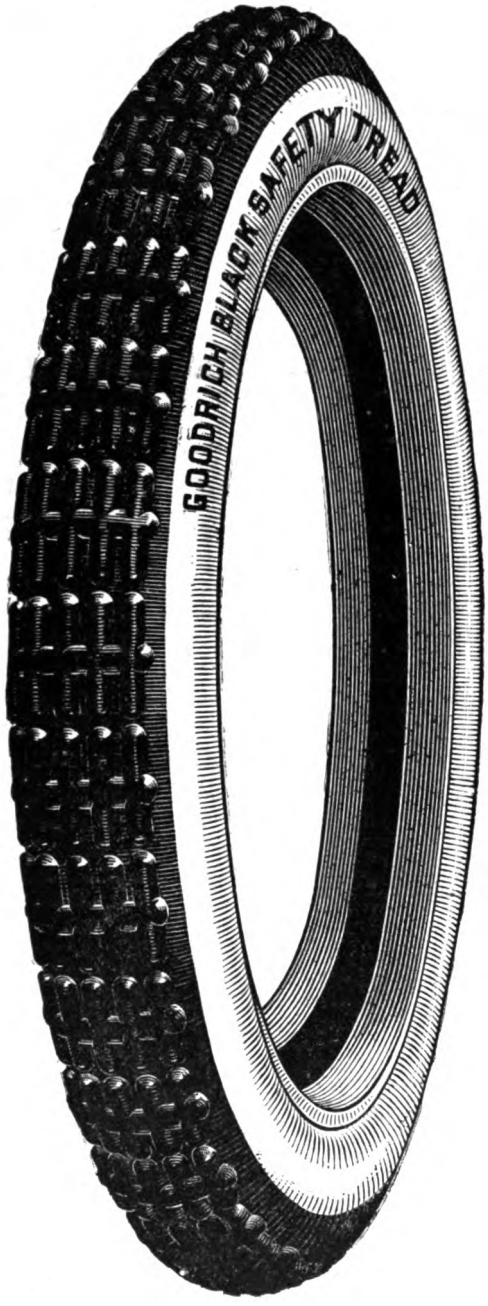
Because,—

—The Safety-Tread on Goodrich Tires is made of a very *unusual, secret,* and *exclusive* Compound, which we will here call "Hyper-Rubber."

It is *much lighter* in weight, than the Rubber used in other makes of Tires, being free from the "sandpapery" ingredients that are heaviest and inert.

Observe, that every *pound* saved on the *weight* of Tires (or any part of a Car *below* the Springs) is equal to a saving of 30 pounds when supported *above* the Springs (ask your Engineer).

Its lightness, however, is secondary to its STRETCH, its enormous STRENGTH and Longevity.



◆ ◆ ◆

AND here is how it acts in Automobiling,—
—When the weight of the Car bears on this clinging "Hyper-Rubber" Tread, and the power is applied to go ahead or reverse, the *stretch* in the Sole (or Tread) of the Goodrich Tire acts as a sort of Lubricant between the Fabric Structure of the Tire and the Road.

Then the Hyper-Rubber "Toes," of the Goodrich Safety-Tread Tire, CLING to the pavement (instead of *grinding against* it), just as your Bare Foot would *cling* to a slippery surface—*without Grind,* and so, with the minimum of Frictional Heat or Wear for *maximum* Traction.

Goodrich "Hyper-Rubber" is made into Goodrich Motor Cycle, and Bicycle, Tires, as well as into Goodrich Rubber Boots, Over-Shoes, Soles and Heels.

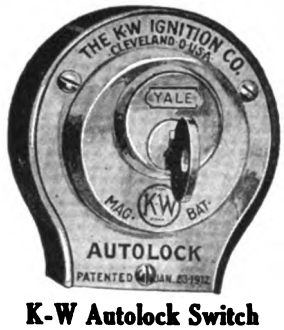
TRADE K-W MARK

PROTECTION

The name K-W is really a symbol of protection for both the motorist and the dealer.

TO THE FORD OWNER—

The K-W Autolock Switch protects your Ford car **absolutely** against theft or tampering when left in garages or in the street.



The K-W Master Vibrator protects you from the annoyance of poor ignition. It gives you sure and better ignition than a high tension magneto—easier starting in cold weather, etc.

The K-W Road Smoothers protect you and the parts of your car against the jolts and bumps common to riding over rough, rutty roads. They give you smooth riding over every inch of the roughest roads.

Right in your neighborhood, you will find a Ford car equipped with a K-W Vibrator, Autolock Switch or Road Smoothers. Ask the owner what they are doing for him every day. He can tell you better than we of the efficiency, economy and reliability of K-W products.

The K-W Autolock Switch positively protects your car against theft, the unauthorized use of your car when left in garages, and is even proof against your self-negligence, because you cannot forget to lock your car.

It takes the place of the ordinary switch, and can be easily attached to any make coil in five minutes—a pair of pliers and a screwdriver being the only tools necessary. Its use is as simple as locking a door. You use a key instead of a plug. To start—insert key and turn to magneto or battery. To stop—turn key to neutral.

K-W Autolock Switch
$3.50 complete

To lock—simply withdraw key. Your key in your pocket is your assurance that you will find your car "locked" right where you left it. Without the key it is impossible to operate the switch. Removing the screws will not remove the lock unless your key is inserted.

Each Autolock Switch is provided with a Yale pick-proof lock and three keys—no two locks with keys alike.

Sold by reliable dealers everywhere, at $3.50; if you don't know your dealer, sent prepaid on receipt of price.

TO THE DEALER—

The integrity of the name K-W prohibits exaggerated claims and promises. It's a symbol of fair dealing, as important to you as this mark on K-W apparatus is a guarantee to the user of quality, reliability and service. This broad, square deal K-W Policy protects you, Mr. Dealer.

The K-W line is a profitable one for live dealers. Write for our liberal sales plan today. 1916 offers a wonderful opportunity.

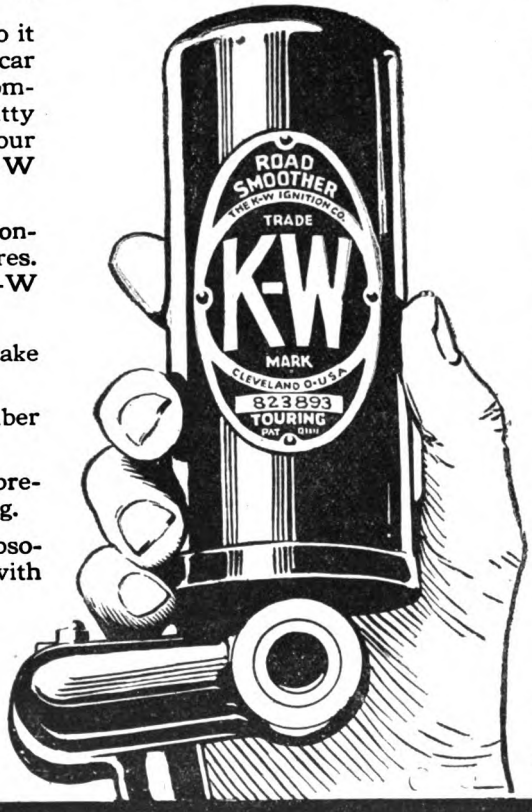
Road Smoothers



QUICKLY APPLIED TO YOUR FORD CAR

Put a set on now—you can do it in half an hour—and get big, car comfort from your light, economical Ford. Frozen roads are rutty and hard to drive over if your car is **not** equipped with K-W Road Smoothers.

Your comfort, safety and economy demands these four features. You'll find them only in K-W Road Smoothers:

1. A spring to effectively take up the shock.
2. An anti-rebound air chamber to check the rebound.
3. Anti-side motion links to prevent side rocking and swaying.
4. A construction that absolutely does **NOT** interfere with the steering.

Each of these features is in itself vital to your comfort and safety. It's only when they are combined in one device that you will get the greatest pleasure from your car.

But after all's said and done, it's results that count; and the K-W guarantee covers not only workmanship and material, but **results** as well.

$15 SET OF FOUR
One For Each Wheel

K-W Road Smoothers are quickly and easily attached. No holes to drill and no tools necessary, except a wrench. And the final and biggest advantage is that they increase the radius of your car's usefulness, and bring you home with "that satisfied feeling" after a day of comfortable motoring.

If your dealer can't supply you, sent prepaid on receipt of price.

"No Car Is Easier To Sell"

The vast majority of cars will be bought this season by people who have owned cars before.

It is human nature to change.

This means thousands of car buyers will ***come down*** from higher priced cars to the common sense Auburn prices. Also thousands will ***come up*** from the cheap cars to the economical but good-looking and roomy Auburn type.

Don't judge until you let us submit the ***proof*** that the Auburn gives "The Most For The Money". And where can you find a car backed by a more reliable and successful institution built upon sixteen years' experience?

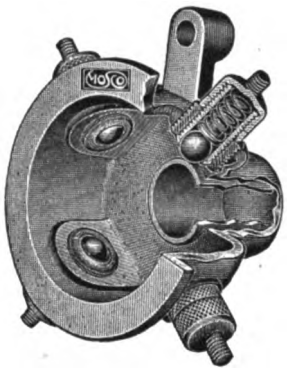
In looks, the Auburn ranks alongside the most costly imported cars.

In mechanical construction, it is sane and dependable—perfectly modern but not experimental in any feature.

We were one of the first to realize that the foundation of permanent business must rest upon ***money-making dealers.***

It costs you nothing to learn the Auburn proposition for dealers, so write us at once. No matter where you live, small town or city, write us—we have something of vital importance to tell you—***we have an offer you cannot afford to overlook.***

Model 6-38; $1050—Six cylinder, 3x5; Cantilever springs; Electric lighted and started; Spacious tonneau and driving compartment; 34x4 tires; 120-inch wheel base; Completely equipped; 3 and 5 passenger models.



Model 4-38; $985—Four cylinder, 3⅞x5; Cantilever springs; Electric lighted and started; 34x4 tires; 114-inch wheel base; Completely equipped; 2 and 5 passenger models.

Model 6-40A; $1375—Six Cylinder, 3½x5; Cantilever springs; Electric lighted and started; Luxuriously roomy tonneau and driving compartment; Folding auxiliary seats; 35x4½ tires; Completely equipped; 2 and 7 passenger models.

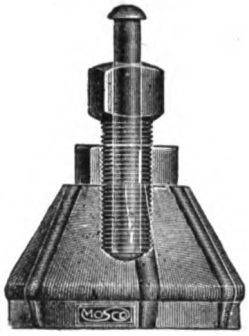
CATALOGUE NOW READY — MOSCO SPECIALTIES — FOR 1916

Bemus Timer Patents {Sept. 24, 1907 / Dec. 17, 1907 / Feb. 16, 1915 / Apr. 27, 1915} Others Pending

WHY were tens of thousand of these Timers sold in 1915? Why were we able to obtain a national distribution in a phenomenally short time? Why did 1,000 dealers from Boston to San Francisco look to us exclusively in 1915 for Timers for Ford Cars? **BECAUSE**

THE BEMUS BALL CONTACT TIMER



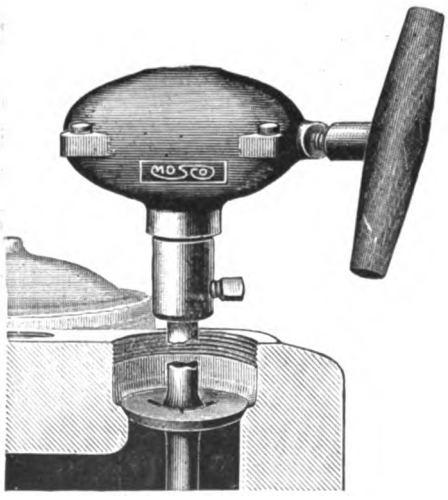
STOPS THAT SKIP. By reason of the method of mounting—on the time shaft—the main cause of skipping is eliminated. You will be surprised at the improvement here.

SMOOTHES OUT THE RUNNING to a degree which you would have believed impossible.

GIVES THE MOTOR MORE POWER, MORE SNAP, STEADIER PULLING, AND DOES AWAY WITH THAT JERKY RUNNING ON LOW THROTTLE.

PRICE $2.25

Reinforcement of advance arm by moulded-in steel bushing is a late feature.



Patented {Mar. 24, 1913 / Dec. 15, 1914}

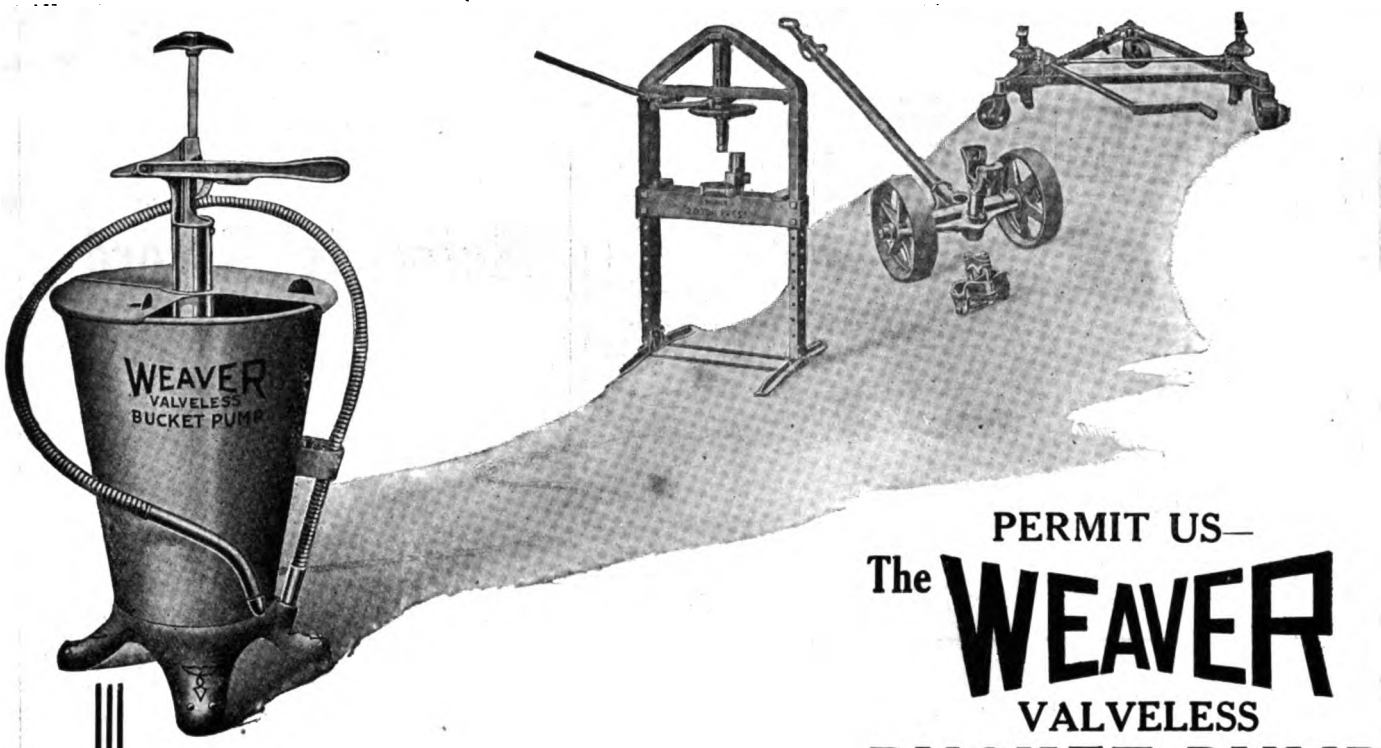
WHEEL PULLERS

(Loose Plunger Type)

For Ford, Overland, Buick and Maxwell Cars

Every practical man knows that the only way to start a wheel which is stuck or "frozen" to the axle is to drive back the axle while pulling the wheel. Two men are required by the old method—the ordinary wheel-puller will never take off a stuck wheel—one man can do it easily with the MOSCO pullers. They have loose plungers extending through the screws—and bearing on the end of the axle. A blow with a hammer on the plunger, a turn of the screw, another drive with the hammer, and the wheel is off—no matter how long it has been on, nor how fast it is stuck. Information and prices on request.

THE MOSCO VALVE GRINDER



This tool differs radically from others in many respects, but mainly in the fact that it can safely be used by those unskilled or inexperienced in valve grinding. It is really more of a machine than a hand tool, and it renders valve grinding an ACCURATE MECHANICAL OPERATION rather than a guess-work hand job. The working principle is absolutely new. The operating handle is attached to a chain coiled on a pulley, carrying the tool chuck. The operator pulls the handle, rotating the tool and the valve; a spring on the chain pulley pulls in the opposite direction, automatically reversing the rotation of the valve. Much greater rapidity can be obtained with the MOSCO GRINDER than with the ordinary tool, resulting in a very superior finish on the seats. Made of the best materials—thoroughly guaranteed. At the price at which it is listed this grinder should be in every tool kit. In ordering state make and year of car or motor.

PRICE, $1.50 Each

PERMIT US—

The WEAVER VALVELESS BUCKET PUMP

WHILE the Weaver Bucket Pump is amply capable of standing upon its own merits—we do not hesitate to point with pride to its long line of "blue-blooded" ancestors—confident that they will win for our infant prodigy instant recognition and endorsement among the most exclusive of the Automobile Fraternity.

The same originality and ingenuity which characterizes each article of "WEAVER" Garage Equipment is strongly evident in this Valveless Bucket Pump.

THE "THREE-WAY" FEATURE

One great advantage of the "Weaver" Pump is the fact that our valveless construction permits lubricants to be handled in "three ways."

First—The lubricant can be forced out of the bucket and into the desired receptacle.

Second—Grease or oils can be sucked out of the differential, transmission housing, etc., and **forced into the bucket.**

Third—Where the lubricant to be removed from the differential or transmission is of a different variety or quality from that contained within the Bucket, the barrel or chamber of the Bucket may be sucked full of the foreign lubricant and discharged again through the hose into a **third receptacle without disturbing the content of the Bucket.**

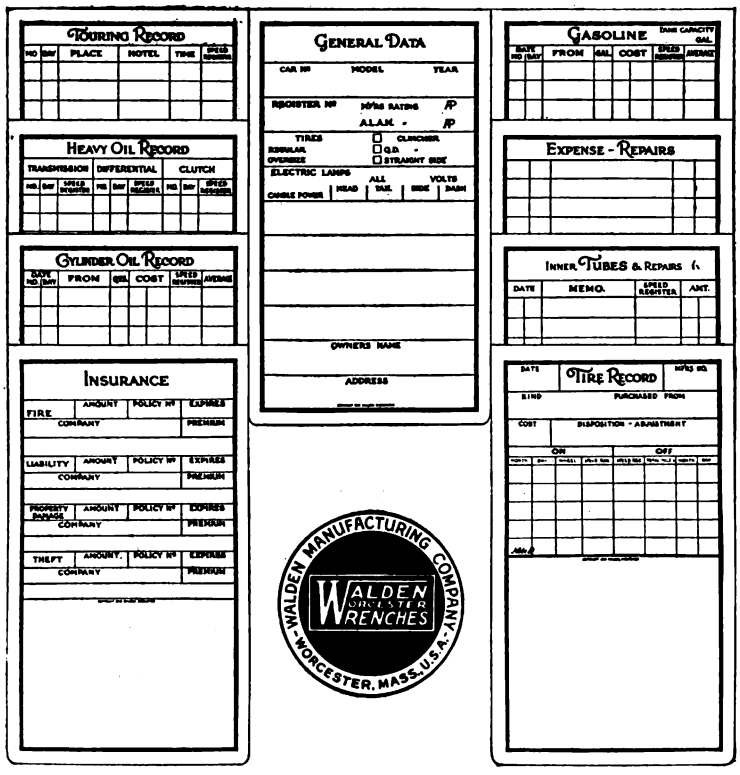
SELF-MEASURING

The barrel has a total capacity of exactly one pound of grease or heavy oils. In handling light lubricating oils which are usually sold by liquid measurements, ten full strokes of the lever handle will discharge exactly one quart.

STEEL HOSE

The Weaver Bucket Pump is equipped with ⅝-inch Flexible Steel Hose which is practically indestructible and cannot be affected by the grease.

CONSTRUCTION



The Bucket proper is made of heavy sheet iron and has a capacity of 25 pounds of grease. The barrel is of 16 gauge brass tubing, two-inch diameter, containing a plunger which will not leak and is impervious to the action of grease and oils. Shipping weight, 25 pounds.

List Price, - $12.00

Harvey
RACINE

BOLTLESS AUTO SPRINGS ARE GUARANTEED AGAINST ALL DEFECTS

All automobile springs look pretty much alike, but there's a vast difference—an unseen difference—in durability and general efficiency.

Harvey Springs are **guaranteed from end to end.** They are made of the finest selected steel. The plates are scientifically formed and tempered on the Harvey patented machines, which make them with an accuracy and uniformity that is not possible to obtain with hand labor. Each step in the manufacture of Harvey Springs is carefully watched and every spring is carefully inspected and tested before being shipped. You may rest assured that all springs passing our rigid inspection will give absolute, lasting, positive satisfaction. Harvey Springs are

MADE WITHOUT A HOLE AT CENTER

Instead of a bolt, a small depression, or bead, is used to keep the plates from shifting. This preserves all the strength at center, or point of greatest strain.

You can recommend Harvey Boltless Auto Springs without fear or hesitation to your closest friends and most particular customers. They have more real quality than any other springs you can buy anywhere—at any price. They are strong, durable, resilient, easy-riding and

HAVE NO WEAK SPOTS

You can build up a good profitable spring business on the solid worth and merits of Harvey Springs. Send us your orders. We will ship stock springs immediately and are prepared to make special springs to order in shortest possible time. Our Quick Service Department will ship you springs that won't break. Try us on your next order.

JOBBERS, DEALERS AND GARAGEMEN NEED THIS BOOK

It contains a complete list of springs for over 300 of the leading makes and models of automobiles, also detailed measurements, specifications and other valuable information that has never been published before. With this book you can order replacements without fear of making a mistake. Send for a copy of the **"Harvey Auto Spring Book"** today and keep it for quick and ready reference.

WE WILL MAIL IT TO YOU FREE.

We Carry Over 10,000 Springs

We carry over 10,000 Springs in stock at our factory for quick shipment. Harvey Springs are also carried in stock at all leading jobbing centers. Write us for name of your nearest jobber.

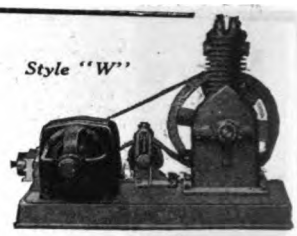
Don't Shoot Oil Into Your Customers' Tires



IT WILL SHORTEN THEIR LIFE AND IT'S NOT NECESSARY—USE A BETTER COMPRESSOR—
: : : : USE A : : : :

CURTIS
Garage Air Compressor

IT WILL FURNISH

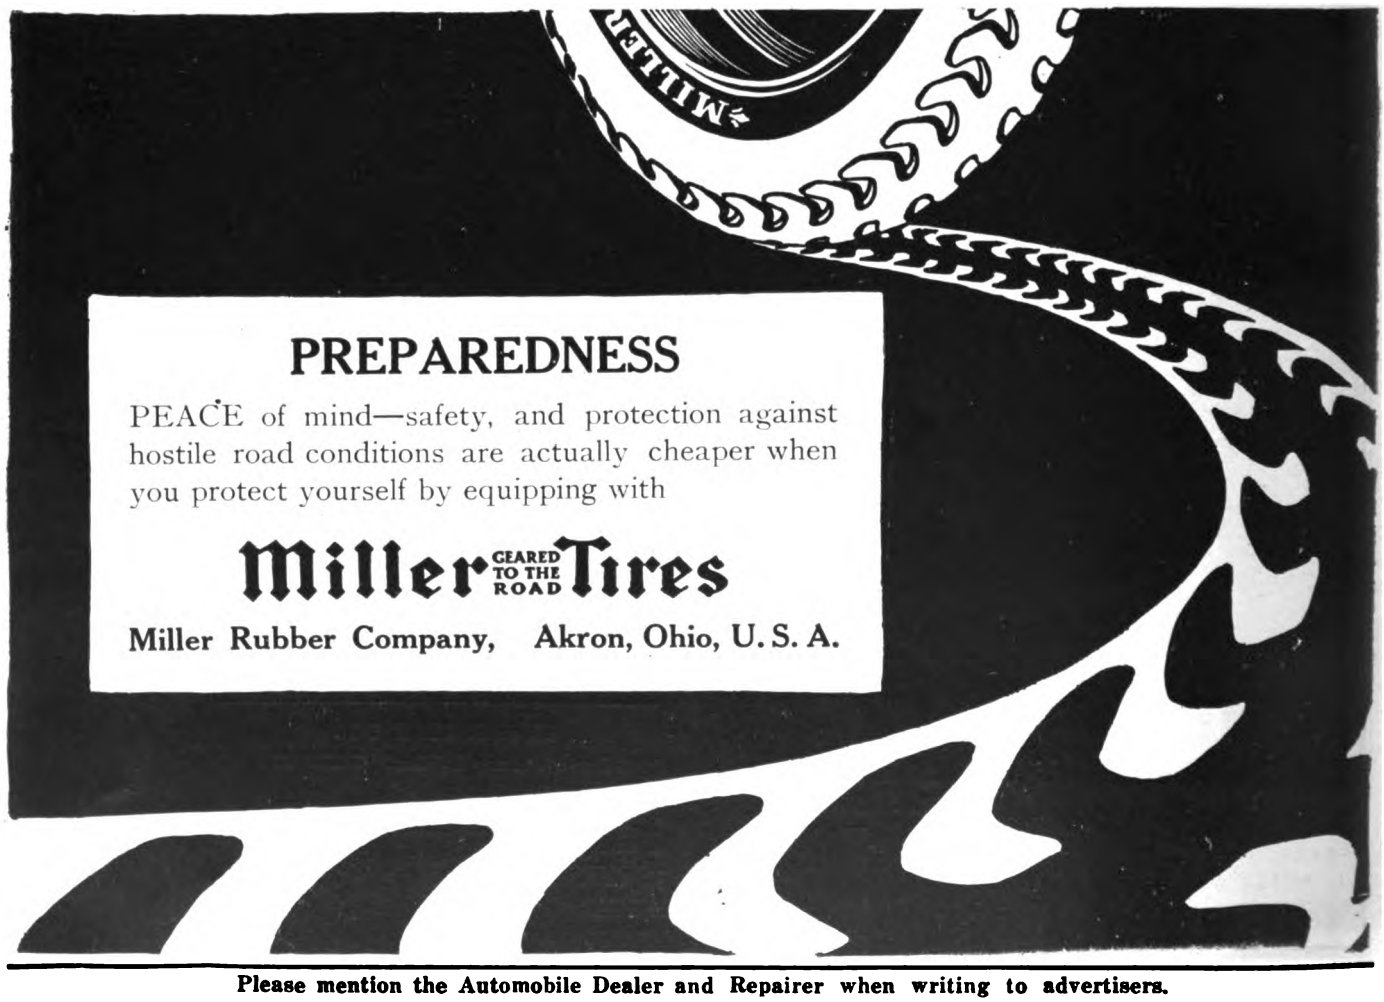
Air Free From Oil

We sell the Compressor alone or complete outfit.

Style "W"

Style "Z"

Style "Y"



Style "X"

Made in five sizes and seventy different combinations. There's one to fit your requirements.

Many features vital to the garage man found on Curtis compressors are not found on other makes, for instance—the controlled splash lubrication system that insures proper lubrication without oil getting into the air line and means better service to your customer at less cost; the unloading device that saves power and permits use of smaller motor (cheaper air); the fan flywheel which means cooler discharge air, and higher efficiency at less cost; safety cage so a broken valve cannot damage the machine; inspectable valves and head removable without disturbing pipe connections; adjustment, die-cast, anti-friction bearings and oil level indicator. We aim at giving you more for your money.

Ask your jobber for prices and data
If he cannot supply it, write us : :

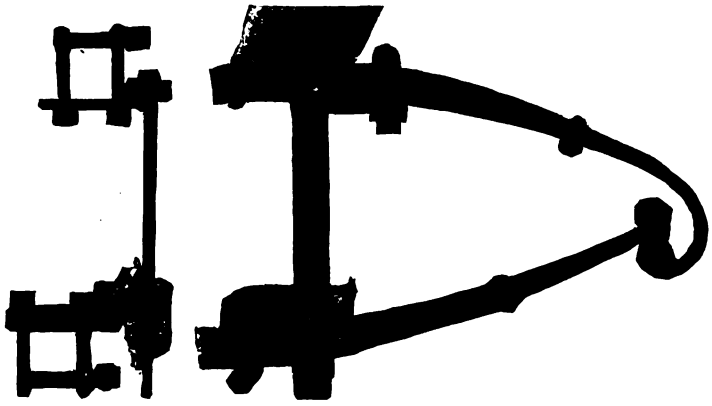
NEW YORK: 30 Church Street

PREPAREDNESS

PEACE of mind—safety, and protection against hostile road conditions are actually cheaper when you protect yourself by equipping with

Miller GEARED TO THE ROAD Tires

Miller Rubber Company, Akron, Ohio, U. S. A.



Digitized by Google

Micro Piston Rings make you like your car better.

Put in Micro Rings and you can fly over any kind of a hill; you will have less carbon to remove; less spark plug trouble; less regrinding of valves; and you will save the oil that ordinarily gets on top of the pistons and makes your car smoke. Once you try Micro Rings you couldn't be satisfied without them. **Price, Each, $1.50.**

MICRO PISTON RING CO., Inc., 1960 Broadway, New York

FRONT VIEW SIDE VIEW

THE car springs with the shock absorber attached are like a compound bow and arrow of great power. When the springs rebound there is a brake on the arrow or rod of the shock absorber, resulting in an easy upward movement. The shock absorber will outlast the car.

Simpler, more reliable than any other, requires no care. Money back guarantee. They are cheaper than car repairs, wear and tear, besides the ease of riding.

Wanted—Business-Getting Agents.

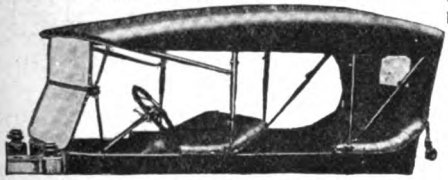
FRICTION SHOCK ABSORBER CO., Kingston, N. Y.

CLEVELAND TOPS *for* FORD CARS

Cleveland Regular Top For Ford Touring Cars

Covered with heavy 32 oz. Auto Rubber, built right over Ford Body Frame and guaranteed to fit. Has smooth deck or roof. Extra quality wood bows. Shifting Handy Style reinforced bow sockets. Large celluloid lights in curtains. Best of workmanship. Waterproof and durable.

Cleveland One-Man Top For Ford Runabout



Above illustration shows genuine "Jiffy" curtains on One-Man Top for Ford Runabout.

Presents fine appearance. Allows unobstructed view from seat. Has lots of clearance, making it very convenient getting in and out of car. Eliminates the cotter pin nuisance. Covered with Mohair. "Lift-the-Dot" fasteners which button like a glove and cannot be blown open.

Cleveland One-Man Top For Ford Touring Cars

Most easily operated "One-Man Top" made. Covered with waterproof mohair or rubber. Made with either regular or genuine "Jiffy" Curtains.

Cleveland Slip Roof Outfit "A"

Makes the Old Top New at about one-half the price of the complete top. The outfit consists of a new heavy rubber roof, quarters, back curtain with celluloid light, and back stays, stitched and ready to slip over the old top frame. Furnished with necessary tacks and welt. Easily put on by any car owner at about one-half the cost of a new top.

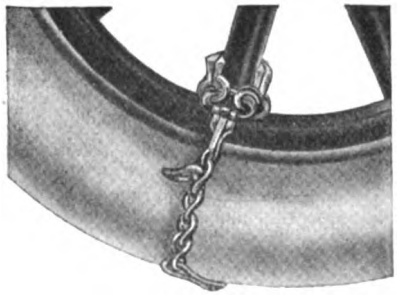
Woodworth Trouble-Proof Tires

ELIMINATE TIRE TROUBLES. SAVE MONEY.

Woodworth Trouble-Proof tires are carefully hand made from the very best materials obtainable. They are guaranteed against punctures and blow-outs for 5000 miles and on light cars they will average from 10,000 to 15,000 miles. The puncture-proof strip used in these tires does not stiffen the tire so as to make it ride hard or consume unnecessary power. The Woodworth Trouble-Proof Tires run and ride as easy as the ordinary plain tire.

Think of the satisfaction of having tires you can absolutely depend on, especially when they cost you not more, but less, per mile to run than ordinary tires.

Send for full information and prices.



AGENTS WANTED IN UNOCCUPIED TERRITORY

LEATHER TIRE GOODS CO., Sole Manufacturers, NIAGARA FALLS, N. Y.

EASYON TIRE CHAINS

For Pneumatic and Solid Tires

EASYON CHAINS are single cross chains held on the tires by fastening to the spokes.

The fastener consists of two galvanized snaps connected by galvanized steel links curved to fit around opposite sides of the spoke. One ring has a hook on one end making it possible to clasp it around the spoke very quickly and easily.

The fastener is covered with leather where it comes in contact with the spoke and felloe and will not mar the paint.

The cross chain for pneumatic tires consists of a long narrow link in the middle with a number of short links on each end.

The middle link presents a perfectly round, smooth surface to the tire which does not wear the rubber as a number of short links will, and being approximately straight the ends stick out, taking a deep hold in mud or snow but cause no bumping on pavements. The short links on the ends of the cross chains make it possible to adjust the chains to different sizes of tires by hooking the snaps into the different links.

To remove the chains it is necessary to unhook only one end of the chain and when re-applied the other end will not require re-adjustment.

The great advantage of EASYON CHAINS lies in the fact that they can be applied and removed so easily even after one gets stuck in the mud.

Instead of using chains at all times in bad weather for fear you may get stuck where you cannot put them on, you can carry EASYON CHAINS and put them on after you find they are really needed. In this way you can save a great deal of wear on both tires and chains.

EASYON CHAINS are just the thing for use with non-skid tires to give the extra grip on the road that is needed when running in deep mud and snow or on ice. They also make a very neat, light and convenient non-skid for front wheels to prevent side-slipping.

EASYON CHAINS wear longer than others, cost less, and it is much easier and less expensive to renew the cross chains.

EASYON CHAINS have fasteners especially designed for wood wheels but they will work on wire wheels if adjusted reasonably tight. It is advisable to adjust the fastener around two wire spokes instead of one.

EASYON CHAINS are packed with a set of eight complete fasteners and cross chains in a small bag; four for each rear wheel, enough to give good traction on any road surface.

Made in Three Sizes for Pneumatic Tires.

Prices for Pneumatic Tire Chains

Size 3½ fits 3 in. or 3½ in. tires.....$2.60 per set
Size 4½ fits 4 in. or 4½ in. tires..... 3.50 per set
Size 5½ fits 5 in. or 5½ in. tires..... 4.50 per set

Easyon Solid Tire Chains

are similar to the pneumatic tire chains except that the fasteners are larger and stronger and the cross chains are made of heavy twisted links.

Made in Three Sizes.

Small size fits single tires no larger than 3 in.....$3.50 per set
Medium size fits single tires from 3½ in. to 5 in..... 6.00 per set
Large size fits Dual tires..... 6.50 per set

EASYON CHAINS will be sent express prepaid on approval to any part of the U. S. or Canada.

A JOURNAL OF PRACTICAL MOTORING

Registered in the U. S. Patent Office

VOL. XX, No. 4. NEW YORK, DECEMBER, 1915. PRICE { 10c PER COPY / $1.00 PER YEAR

STARTING THE ENGINE.

Some of the Factors That Contribute to the Difficulty.

BY C. P. SHATTUCK, M. E.

The time is fast approaching when the motorist, particularly the new owner of an old car, one that must be started by hand, will experience difficulty in starting the engine. The average new owner is of the opinion that the present grade of fuel is wholly to blame, but a careful analysis of the average case will reveal a number of other factors which contribute to difficulty in starting. The writer is of the opinion, and his contention is borne out in practice, that much of the difficulty experienced in starting is due to causes other than the gasoline, and that by remedying these troubles it will not be necessary to exhaust one's self by ineffectual cranking.

Before discussing methods and devices for overcoming troubles, some of the troubles confronting the manufacturer of carburetors and having a bearing upon the subject will be of interest. It is not generally known to the laymen that it is a simple matter to construct a carburetor that will make for easy starting in cold weather, but unfortunately such a design does not obtain the other results sought; that is, operative efficiency is more or less sacrificed. The mileage obtained from a gallon of gasoline is a factor which largely influences the decision of a prospective purchaser to a large extent.

The object of the designer of a carburetor is to obtain a device that will suitably proportion the gasoline to the air and to properly vaporize the fuel. In all practical carbureting devices the liquid fuel is brought into the presence of the air with which it is to combine by means of a pressure depression exerted upon the discharge end of a tube or passage so constructed and located as to cause the fuel to be carried off by a moving column of air.

The proportioning of the fuel and the air is subject to irregularities as a result of temperature change, not always seasonal changes, but the motor itself. The last named changes are greatest, especially with low atmospheric temperatures, and as a result irregularities in mixture proportioning are greater in the winter than in the summer. Changes in the temperature, whether it be the air entering the carburetor, or of the motor proper, tend to alter mixture proportions. There are other factors involved but a discussion of these technical points will not be of interest to the reader, but the above named conditions will afford some idea of the problems encountered by the carburetor manufacturer. With the more modern types, equipped with devices for enriching the mixture for starting without interfering with the operative mixture, the greater part of the difficulties have been overcome.

The older types of carburetors generally require more or less changing in the adjustment of the fuel and air supply, and a mixture making for easy starting is generally likely to be excessively rich at operating speeds, as is frequently noted by the exhaust of old motors in cold weather. The exhaust is accompanied by a pungent odor and black smoke. With such carburetors operative efficiency is sacrificed for easy starting, and many owners prefer the latter to the former.

A factor contributing largely to difficult starting of the old type of motor in cold weather is the design of the intake manifold, a most important adjunct of the carburetor. The marketing of a motor fuel of low volatility has resulted in the redesigning of intake manifolds. They are made shorter, are placed near the top of the cylinders, where the heat of the water jackets assists in vaporization of the fuel, and in several instances the intake manifold is entirely eliminated, the inlet passages being cast

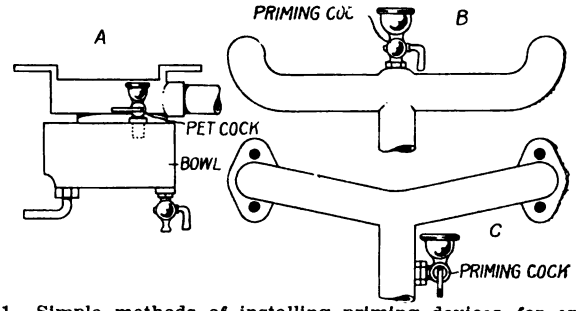

Fig. 1.—Simple methods of installing priming devices for enriching the mixture for starting in cold weather.

with the motor. Such construction, coupled with a a rapid rotation of the crankshaft by the motor starter, has eliminated starting troubles to a great extent, but not wholly, as will be pointed out.

When the mixture leaves the carburetor it is not a true gas, it consisting chiefly of liquid particles carried in mechanical suspension in the moving air current. A definite velocity is needed to maintain this suspension, and the moment the speed of the moving air current is decreased below a certain velocity the larger particles of fuel are deposited on the walls of the intake pipes and the mixture no longer contains that amount of gasoline that was metered into it by the carburetor. Whenever a moving fluid comes in contact with foreign surfaces the velocity of the surface stratum is markedly diminished by the friction of the contact, termed "skin friction," an amount dependent upon the condition of the smoothness of the frictional surface. That portion of the air column which comes in contact with the walls of the manifold frequently falls below the critical velocity, even though the interior of the column be maintained well above it. This wetting of the surfaces is commonly, but erroneously, attributed to "condensation." Condensation implies a change of state from a gas to a liquid. As the gasoline has never been a gas, during the process under consideration, the term condensation is a misnomer.

The liquid film, wetting the walls of the manifold,

Digitized by Google

is subjected to the attraction of the moving air column, with the resulting evaporation of the liquid. This evaporation takes place only from the surface of the fuel and is a slow process with low grades of gasoline. The processes of deposition and evaporation are noted when starting some engines on a cold morning. After running a short time the rate of evaporation, assisted by the rise of the temperature beneath the hood, equalizes with the rate of deposition and the motor runs smoothly and without that "surging."

The tendency of the liquid to seek the outer periphery of all curves in the induction pipes is another factor increasing the proper distribution of a mist-laden mixture. No matter how finely the fuel may be comminuted, so long as it remains a liquid its specific gravity is greater than that of the air and, being thrown violently against the outside of the curve by centrifugal force, its velocity is lessened by the impact. The result is a tendency to impoverish the mixture. With the tortuous passages of some manifolds, it is probable that nearly all of the unevaporated fuel is deposited before reaching the cylinders, and it is not uncommon to note with poorly designed manifolds an actual dripping from around the throttle shaft and from the primary inlet to the carburetor, after one has become exhausted by the ineffectual cranking of a cold motor. While these defects in manifold design have been eliminated to a great extent in the modern motor, it can be readily seen that some of the starting troubles experienced are due to inefficient manifolds. It is important that each cylinder receive an equal quantity, as well as a mixture possessing the same chemical and physical characteristics. Some older types of motors preclude this. Add to these complications those present with the early forms of carburetors and it is no wonder that trouble is experienced in obtaining a mixture that will afford easy starting and operative efficiency.

With some types of motors it is essential that the crankshaft be rotated at a high rate of speed or spun. Unfortunately, however, there are some motorists who do not master the knack of overcoming the starting torque to spin the motor. This is particularly true if the engine has stood for a long time and the temperature is well below the freezing point. And if there be abnormal space between the walls of the cylinders, rings and pistons, the congealed oil makes it more difficult to overcome the starting torque.

Difficult starting in cold weather is frequently the fault of the owner. Dealing first with the car not equipped with a motor starter or priming devices and relying upon dry cells or a storage battery as a source of current supply, it may be said that many motorists do not take into consideration the fact that batteries that will start the motor easily in warm weather will fail in the winter. Cold has a certain effect upon electricity derived from chemical action and because of this fact the dry cell and storage battery require careful attention. If the dry cells give a reading below 10 amperes, it is best to discard them for all new. One poor cell in a group will set up considerable resistance to the passage of the current. Storage batteries should be maintained according to the directions of the maker, even the cells charged by the generator of the lighting system.

Timers or commutators often are responsible for difficult starting, especially if dirty, for certain foreign elements set up a considerable resistance to the passage of the primary current, resulting in a weak spark. Worn rollers and metal segments and loose bearings prevent a good contact, and similarly if the points of the vibrating coil be fused or dirty, they impose a resistance in the circuit, affecting the intensity of the spark at the plug. Dirty and oil-soaked wires in both the primary and secondary circuits decrease the efficiency of the spark, for it should be borne in mind that the intensified electricity will always take the path of the least resistance.

Failure to start the motor on the magneto—the true high-tension type—in cold weather is frequently due to too large a gap of the contact points or the points may be pitted or dirty. The contact points will wear after considerable service and the space between them when fully separated should be measured with the gauge accompanying the magneto. In the inspection of the components of the ignition system, the motorist, as a rule, overlooks the spark plugs. Many owners do not take into consideration that certain types of plugs have electrodes that are affected by the intensified current; that the gap is increased by the burning action of the current. This increase is so slow that it is not noticeable until the motor is hard to start in cold weather. The writer recalls a particular instance which illustrates how one can be deceived when measuring the gap of a spark plug. The car was of a popular make and the best results were obtained with a 1/32 inch gap. The motor was difficult to start and at low speeds missed. The owner, a practical motorist, had been over everything without locating the trouble. He had gauged the gap and found it apparently correct, but upon the writer examining the electrodes he found that the current had burned quite a recess in the electrode of the shell. This increased the gap considerably. Upon installing a new set of plugs with the gaps correctly gauged the hard starting and missing disappeared. It demonstrates the importance of conforming to the gap recommended by the maker of the ignition system and the advantages of a spark plug employing eelctrodes not easily affected by the intensified current.

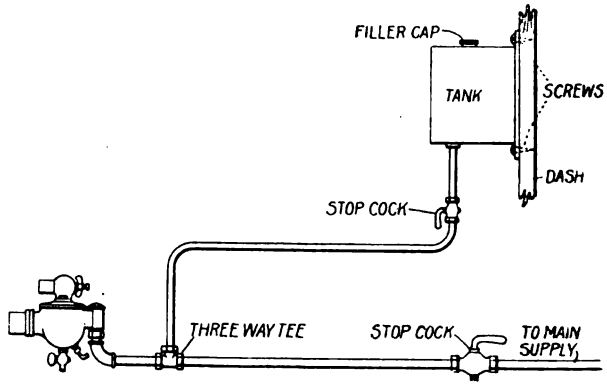

Fig. 2.—Home-made priming apparatus for supplying highly volatile fuel until the motor becomes warm.

Natural wear of the spark control linkage and the driving mechanism of the ignition apparatus will contribute to hard starting. Invariably the motorist who starts his engine becomes accustomed to placing the lever on the quadrant in a certain location; in fact, it becomes a habit. With the wear of the linkage, etc., the spark occurs later, and if the motor be started on the magneto some owners do not take

Digitized by Google

into consideration the fact that it is not always possible to attain the same rate of speed when rotating the crankshaft in cold weather as in the summer. Consequently the spark should be further advanced.

Poor contacts at the switches are factors making for trouble in starting, and worn pins retaining the throttle valve of the carburetor admit extra air which dilutes the mixture at cranking speeds. Worn valve stems or guides will admit extra air as will imperfect gaskets between the cylinders and flanges of the intake manifold. Frequently dilution of the mixture is caused by leakage of air between the carburetor and manifold. The amount of air drawn in may be small, but if the fuel supply must be increased to compensate for the extra air, the mixture will be unduly rich at operative speeds, which will breed engine troubles.

When one or more of the above-named conditions exist, it is not reasonable to expect the motor to respond to ordinary treatment. One does not desire to expend large sums in correcting faulty design, but starting can be greatly improved by an inspection of the components mentioned to note if faults exist. One must not expect that the installation of a motor starter on an old motor will wholly overcome starting troubles. Under certain conditions the motor starter must have assistance. It will rotate the crankshaft but it will not vaporize fuel of low volatility nor correct ignition or mechanical troubles. Even if the car be equipped with a motor starter, in extreme cold weather and particularly when the car has been standing a long time, it is advisable to enrichen the mixture or prime the cylinders or both. The writer has noted instances where the motorist exhausted the battery in endeavoring to start without priming, etc. If the motor does not respond, do not continue to waste current, but prime the cylinders.

The motorist who garages his car in a heated building and who does not expose the motor to low temperatures for any great length of time when it is not running, does not as a rule experience trouble in starting. But the automobilist whose garage is not heated must employ means to coax the engine into life. There are thousands of owners storing their cars in unheated buildings, especially in the suburban and country districts, and whose means do not warrant the installation of heating apparatus. Under such conditions the mixture must be enrichened, either by temporarily restricting the air supply or increasing the amount of fuel or both. And it should be borne in mind that during cold weather the air supply should be cut down slightly or the fuel supply increased. The amount and method will depend upon the carburetor.

The simplest form of priming is to displace the spark plugs and pour about a tablespoonful of gasoline into the combustion chamber; that is, if the motor be not provided with priming cocks. Spark plugs having priming features are marketed and will save time and effort. A few words on the difference between priming and flooding will be of value to the novice and to some experienced motorists. Priming means injecting a rational amount of fuel into the cylinders. Flooding is the addition of more gasoline or other inflammable fluid for the same purpose. The latter condition makes starting more difficult and sometimes impossible. When on an extreme cold day the cylinders have been primed and the motor fails to respond, it is useless to pour more gasoline into the cylinder until the first quantity has been removed. Open the primary cocks and with the ignition switch on, crank the motor. Then close the priming cocks and the motor will generally start. Enriching the mixture does not mean supplying so much fuel that it will not ignite.

Where there is a tendency for the fuel to be deposited on the walls of the intake manifold, and the slowness of the liquid to evaporate creates a lean mixture, as previously described, the home-made devices shown at Fig. 1 will be of value. Those shown at B and C consist of a priming cock fitted to the intake manifold, an arrangement obtained by by drilling and tapping a hole to take the thread of the priming cock. A small quantity of the priming fluid is thus introduced onto the walls of the intake manifold overcoming the lean mixture. The method shown at A is utilized by an experienced motorist owning an old car with an early vintage carburetor. It consists of a petcock so placed on the bowl of the carburetor that the priming fluid raises the level in the float chamber, and as the motorist employs a solution of ether and gasoline, his engine responds readily.

Another home-made priming device is shown at Fig. 2. It consists of an auxiliary fuel tank mounted on the motor side of the dash. The tank is connected with the main fuel line by tubing, and a shut-off valve controls the flow of the liquid. A stop cock is also incorporated between the main tank and the tee of the auxiliary line for the purpose of shutting off the fuel from the large tank. To utilize, the main supply is shut off and the carburetor drained. This removes the regular fuel and in addition insures a clean carburetor. The auxiliary tank contains a mixture of ether and gasoline, about one part ether to five of fuel. As soon as the motor becomes warmed up, the supply is cut off and the regular fuel supplied. The owner employing this device also utilizes it for feeding kerosene to the cylinders for assisting in removing carbon. In constructing the tank the filler cap should be drilled to provide an air vent as the flow is gravity.

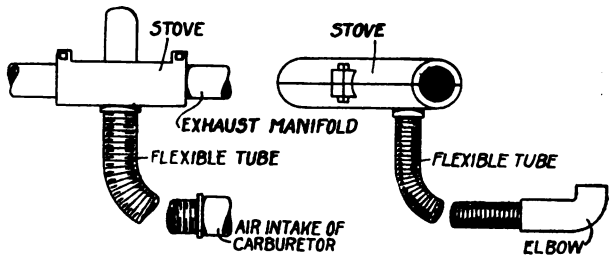

Fig. 3.—Hot air attachments which assist in starting after the initial explosions.

Some cars cannot be started easily by priming and among the practical methods are: covering the air intake of the carburetor and pouring boiling hot water over it and the intake manifold; utilizing a cloth bag about two or three feet long, filling it with sand and placing in the oven of the stove until thoroughly heated, then wrap the bag around the intake pipe and carburetor; using warm water to refill the radiator when the water has been drawn off, and moistening the electrodes of the spark plugs with gasoline.

Suggestions have been made for employing an electric light or a lamp under the hood, but the former will require considerable time and the latter is not practical, especially if the carburetor should flood. There are numerous apparatus and devices

Digitized by Google

marketed which greatly assist in overcoming starting troubles. These provide means for injecting fuel into the intake manifold or cylinders, heating the interior of the intake pipe by electricity, etc.

Relative to the utilization of the heat of the exhaust gases, it does not make for easy starting, but after a few intial explosions are obtained the heat is advantageous. Fig. 3 shows the application of two different types of hot air outfits. Both consist of a stove or housing which is clamped over the exhaust manifold, and the heat is conveyed by means of a flexible tube to the fixed air intake of the carburetor. The heat transferred greatly assists in vaporization of the fuel and also makes for economy. These attachments are not expensive and can be obtained to fit practically every type of standard carburetor.

While the experienced motorist is familiar with the advantages of thoroughly blanketing the radiator when the car is to be left on the street, etc., the novice will find that by using two robes and covering the hood also, that the heat will be retained for a considerably longer period, for it should be remembered that the heat from the motor rises.

INTERMITTENT MISFIRING.

A Few Rules That May Help Out of an Annoying Trouble.

Investigation, diagnosis, and cure of regular misfiring, whether in one or more cylinders, are simply child's-play. It is the rarer care of irregular, occasional and intermittent misfiring that worries. Even the expert cannot usually go at once to the seat of trouble. He has to "nose around" till he "spots" it. The only consolation about this class of troubles is that they tend ultimately to become chronic, and then they are easily traceable by the regular tests, and easily cured.

You feel, from the faltering of the engine, that misfiring is going on at odd times. You stop the car, and apply the regular tests at the coil, with the engine running. Under such tests, however, the engine may behave perfectly, giving no sign of misfiring. Thinking you may have been mistaken, you run the car once more, when the faltering begins again. No doubt about it this time; yet the coil tests once more tell you "All's well."

The fact is that the tests will rarely tell you anything about intermittent misfiring; they will only tell you about regular misfiring; the reason, of course, being that conditions, when the car is running, are different from those existing when the car is at rest. Chief among those different conditions are road vibration, speed and heat—though there are others.

So you must get at the bottom of your trouble by an entirely different method from that of the coil tests. It is not a very satisfactory method, but it is the only one available. You must make a mental note of the particular conditions existing at the time when, and when alone, misfiring occurs, infer from them the possible causes of the misfiring, make your investigation among those possible causes, and any adjustments or replacements that may seem to be needed in the parts concerned.

Here are a few guiding rules on those lines—by no means complete or exhaustive—which may help you in time of trouble:

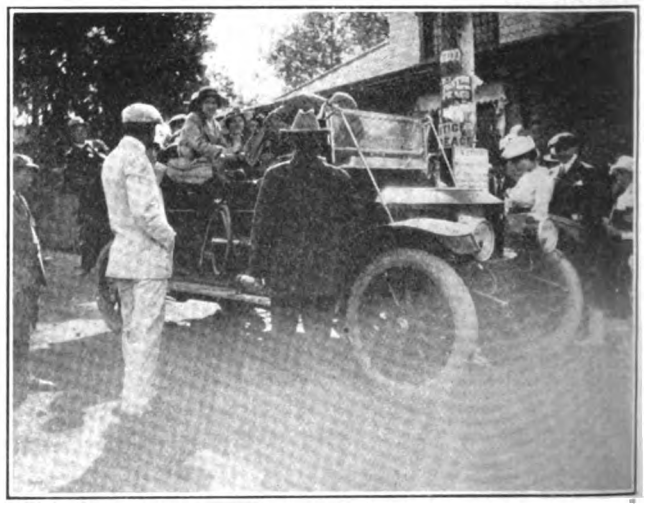
If misfiring occurs only at high speed (irrespective of engine heat), suspect the commutator cover.

If it occurs at slow speed (irrespective of engine heat), suspect the commutator brush.

If it occurs in picking up speed (whether in starting or otherwise), suspect too close adjustment of the carburetor disc, i. e., shortage of gasoline at the jet.

If it occurs at the top of a long, steep hill, when the engine has got very hot, regular firing recurring when it has had time to cool down after the top of the hill has been passed, suspect a cracked spark plug.

If it occurs on any up-grade, before the engine has had time to get really hot, suspect looseness of the coil units in the box, particularly the two middle ones.



If it occurs under any conditions, but especially in fast running on the level or downhill, with throttle nearly closed, and is accompanied by spitting and popping in the carburetor, suspect obstruction in the gasoline supply at jet.

If it occurs only over a bumpy road, suspect a loose low-tension contact somewhere (probably a terminal), or a bare spot in the insulation of one of the low-tension wires, bumping causing the bare spot to shake into contact with some conductor in its neighborhood.

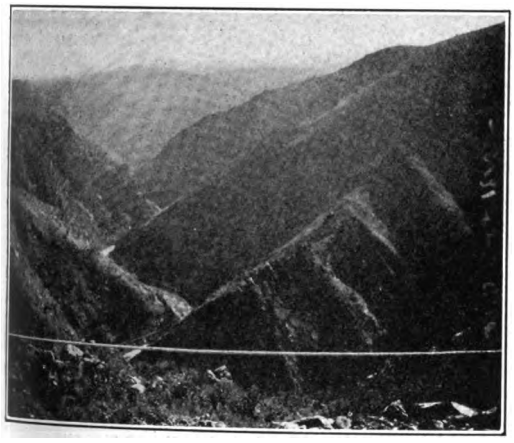
A TRIP TO THE CLOUDS.

Made in an Automobile and by the Lincoln Highway Route.

Now that it is over and done, sister declares she would not take a small gold mine for the experience,

The Start.

but at the time—well, if she could have stepped off and walked, and it hadn't been so terribly far to the bottom, and our tickets only good on a certain train, it is dollars to peanuts she'd have deserted the car on the very first ridge and left us and it, to our fate in the clouds.

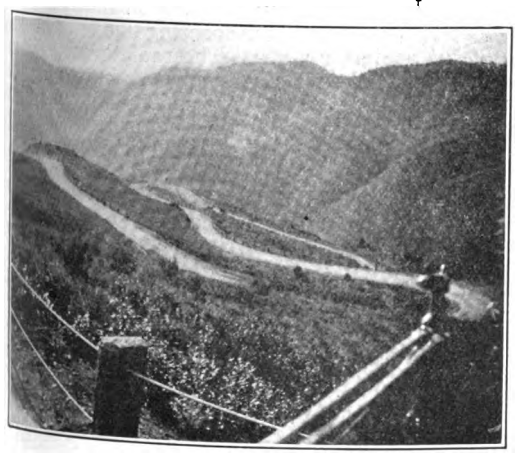


Now, after all, could you so much blame her, she being a timorous body, for automobiling out from Golden, Colorado, on the Lincoln Highway, is absolutely the most thrilling in all the West. The motoring takes its start at Golden. Your equipage is a four-seated affair, each seat meant to hold three riders, and in charge of a genial young fellow wearing khaki. The route leads past an old statehouse of Colorado, and then on and up the heights. Cotton-

Digitized by Google

woods shade it lightly and here and there is an attractive camping-ground. Speaking generally, you seem to be headed for a long range of mountains and the cattle feeding near you seem to bob their heads as though in knowing grimace of what lies in store.

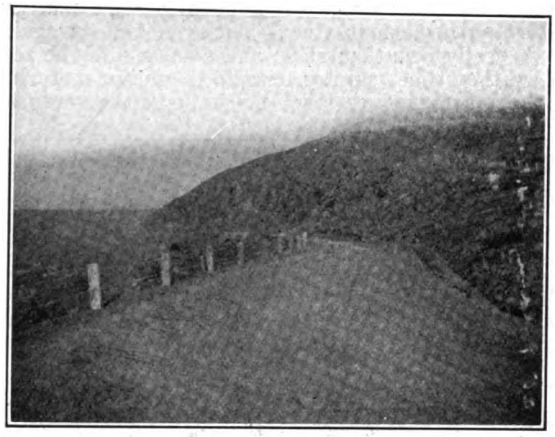
At first, the scenery distracts and you do not notice how you're rising. Slopes, with a green tree growth are all around, and on these the shadows of still other slopes rest. The road then begins to serpentine and ere you know it you have turned around and are traveling back toward Golden, but on a higher level, of course. What is more, you see your own road ahead, and you begin to realize how dizzying its edge is.



Meantime, speed is growing and the chugs of the engine grow louder. Down in the valley the School of Mines takes your notice. It is soon gone and in-

A View of the Road.

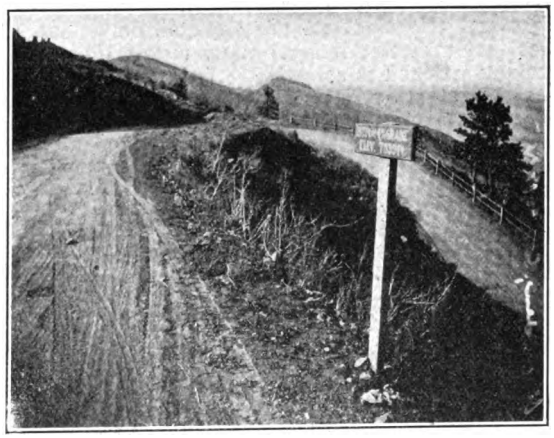
stinctively you are noting the broad earthen turnouts at the curves of the pike. Signs prohibiting the cutting of Christmas trees and other foilage on the slopes skim past you. The entire district is a park you recollect, and meantime you are traveling ever higher.



You notice the loco weed and the wild pea in the

Back and Forth.

mountain meadows; the lovely view out over a green valley; the men at work on the road dart past you, and your seatmate, you overhear, is taking some comfort in the series of stone posts, joined by a steel cable, at the roadside. That cable should halt, at least momentarily, any auto skidding at its stage of of the road.



Higher and ever higher! It is a typical mountain

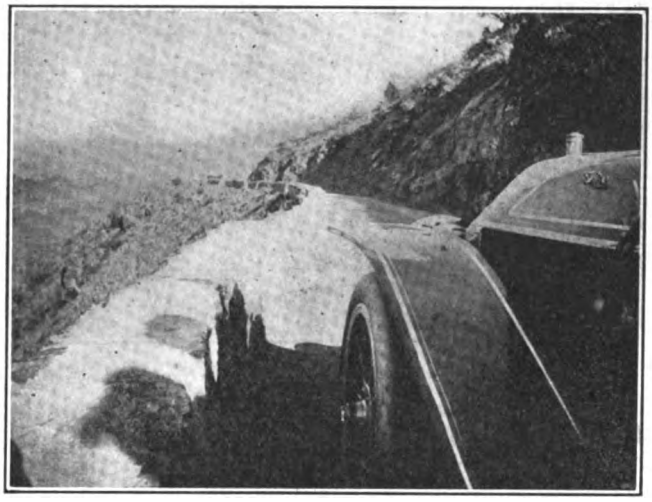
The Protective Chains.

ride this, if ever there was such. The highway itself is of a hard, yet loam-like stuff.

Ever so often other autos are passed. Altitude the world over seems to dizzy the mind and these go by at a pace which would say, "puts faith in God and your brakes alone." We stop to take up a boy

A Switchback.

who is bound for the summit and has a "pull" with the driver, and cramped a bit by this new fare set between us, we continue on to "Excelsior," as it were.



We are coming, by this time, to a new line of flora. Slopes covered with the yucca begin to rise and a low chapperal. A fine, open stone springhouse is a favorite place to stop and enjoy the glorious view of mile on mile of the mountain tops. "Windy Point," the guides have dubbed this, and you soon know why, as you tarry to count the endless peaks within view. Past the point, the road leads into forests of cedars. The chauffeur sounds the whistle as he rounds every curve here, and though he hardly slacks speed there's a sense of danger in the air. Occasionally a wagon is passed. Once, as you slow down near such, you make out four separate loops just below in your trail. Far, far in the distance the town is visable. The mounting is a bit easier be-

Digitized by Google

yond here, but in turn you are out at the very brink of the precipice and you get a dizzying sense of absolutely no protection at the edge.

Leaving Golden 4:17 of the afternoon, at 4:32 you make your first real stop on a high plateau, affording a glorious view. Then, on and on again, by a really beautiful slope and squarely to the top.

By that time you are used to mountain motoring and are somehow rested. You take in the views on

Climbing.

every hand, take your pictures and stretch your legs. Then your chauffeur gives some facts of interest. The round trip ride you are engaged on is but 16 miles; you'd declare it is as many more. The highest point reached is some 7,512 feet, and yet travel is not bothered by rain and only three days all last year were they traveled with snow. Twelve autos are in the regular service up here, although, of course, any other motorist is free to come. Ours is a ninety horsepower car, and the round trip uses only three and a half gallons of gasoline. The steep-

Up at the Top.

est grade is a 10 per cent. one, and the mildest is a 3 per center. At one point, a lake, a hundred miles distant, is plainly visible. There, the five minutes' stop is over and you must be going. Down, down, round and round, over and about, and finally you are back at Golden. Safe and sound? Oh, yes, indeed —a glorious trip. Only, somehow, you don't get to Golden very often, and the chances are you'll never take it again.

WHILE DRIVING.

How to Find Out If Anything Is Wrong With the Car.

From G. E. Greenleaf, New Jersey.—One of the best methods a motor car driver can use for finding out whether anything is wrong with the mechanism, is to be alert to new sounds anywhere in the machinery as the car moves over the highway. It is not at all difficult for a person who has driven a car several months to note unusual noises proceeding from the machine and by discovering the cause and attending to it at once he may save much inconvenience at a later date. Missed explosions occur not infrequently during cold weather due to poor vaporization of the fuel. This type of missed explosions is particularly noticeable when first starting the motor and may continue until the motor is thoroughly warmed when it will generally cease if the ignition is in good condition.

Modern carburetors are water jacketed with water from the radiator but this does no good until the motor has been run long enough to heat the water: therefore in addition to the water jacket a hot air pipe with an expanded end surrounding the exhaust pipe should be connected to the carburetor air intake.

The first few explosions will heat the exhaust pipe and the air passing to the carburetor will thus be heated with resulting improvement in the vaporization of fuel.

Sometimes, this "missing" is caused by defective ignition. Possibly, there is a loose connection, a spark plug may be cracked, or the breaker points in the magneto need adjusting. In order to detect whether the motor is firing evenly the cut-out should be opened occasionally, but if there is no cut-out, the car should be slowed down to about ten miles per hour, when any irregularity of explosion will make itself manifest by a jerking motion.

Good modern motors operate very quietly and thus the operator's ears should be alert to any knocking or pounding proceeding from the following sources. The most common causes of knocking are:

Spark advanced too much, carbon in the cylinders, causing pre-ignition and overheating due to some defect in the cooling system. The radiator may have sprung a leak, the water pump may have stopped working, or the water-jackets and radiator may be clogged with sediment. After a motor has been run for a long period the bearings are likely to be worn which will cause a noticeable vibration. Knocks from this cause will be more of the nature of a rap as compared with a sharp, metallic sound for the first mentioned causes. In the event of a continued metallic clang in the motor, the car should be brought to an immediate stop. Otherwise, the overheating will work serious injury to the reciprocating parts, melting out the lining metal of the bearings and even causing the pistons to "seize" or stick fast in the cylinders. Unusual rattling sounds proceeding from the chassis or body indicate that something has broken loose which may be in need of immediate attention. A sudden snap occurring while the car is passing over a rough road should be taken as a warning that a spring has broken. If this is found to be the case, the car should be driven most slowly and carefully until a repair shop can be reached. Very often an ordinary country blacksmith can forge a spring leaf which will serve as a substitute for the

Digitized by Google

original until such a time as the spring can be conveniently repaired.

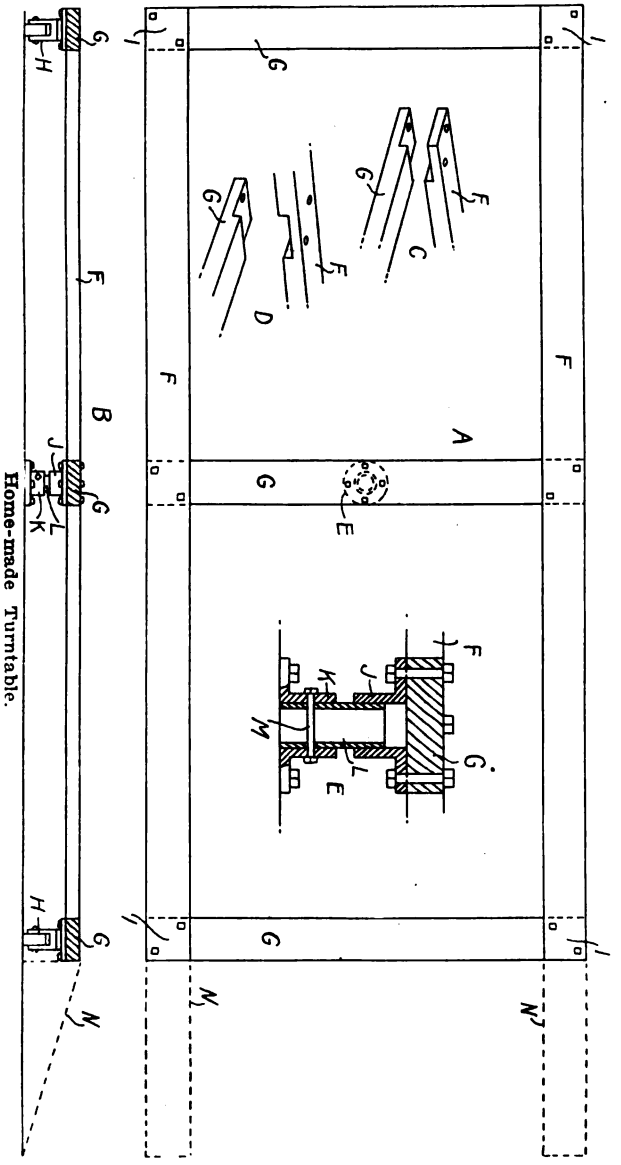
Emergency spring repairers can be bought which can be quickly clamped on the spring at the break and if the car be carefully driven will carry the load safely until such time as the spring can be repaired.

Two pieces of old spring about 12 inches long and two spring clips fitting the springs will serve the purpose of an emergency repair and take very little room in the tool box. One piece of spring is to be placed on top and one on the bottom of the broken spring with a spring clip surrounding the whole at each end, or if the break is near the end of the spring both the repair pieces may be put on the bottom, extending past the break and both clips put at one end around the whole.

If neither of these devices are at hand a temporary repair may be made by placing the largest wrench in the tool kit so that it spans the break and closely winding the whole with strong cord about ¼ inch diameter.

The condition of the tires is a matter to which the driver should give his careful attention. Nothing is more exasperating on an otherwise enjoyable trip than many tire changes. If the car, while traveling over a smooth, dry road, evinces a tendency to skid to a certain side of the road or if it is hard to turn the steering wheel, a tire is flat. This should be remedied immediately as running on a flat shoe even for short distances cuts the tube to pieces besides breaking down the side walls of the tire. One should not take trolley tracks, cross walks, and similar obstructions at high speed, as by so doing several plies of fabric are almost sure to be broken. When the car is housed for the night it is a good plan to examine and remove from the tires any obstructions which may have lodged therein, filling the resulting cuts with some plastic compound. Tires should always be run with the pressure recommended by the makers, unless they are oversize tires which may permit running a little softer.

When the motor car coasts down a hill occasion should be taken to see if the brakes grip with their accustomed firmness. Either set of brakes should hold the car on any hill where traction can be obtained. The novice not infrequently starts off with his emergency brake set. If this is not detected soon, the brake lining will probably be burned out besides throwing a heavy strain on the driving gears and wasting gasoline.



During the stop for luncheon, the driver ought to make a cursory examination of the chassis to see that there are no broken springs or bolts. There should be no dripping of the gasoline permitted for an instant on account of the fire hazard. If the gasoline drips, it is probably caused by the float valve of the carburetor not seating properly or possibly there is a leaky pipe. Many cases of overheating can be traced to the petcock on the bottom of the radiator jarring open, thus allowing all the water to run out.

The writer has not intended to make driving a car seem like a burden but merely to enumerate some of its features which, if given reasonable attention, will tend to reduce repair bills and promote for the greater enjoyment of a willing servant.

A porcelain spark plug may be tight when cold and leak when the engine is hot. This is due to unequal expansion of metal and porcelain.

Suggestion for a Turntable.

From E. G. B., New York.—The turntable shown in the illustration is made of wood, and is designed accurately for Ford cars, but can be so constructed as to accommodate any make of car with a longer wheel-base, by using longer side members, while the rest of the construction remains the same throughout. In the sketch A is a plan view. B is a sectional view. C shows the method of connecting the end members to the side members. D indicates how to connect the center member to the side members.

View E shows the construction of the center bearing, on which the turntable revolves. The side members, F, are 11 feet 4 inches long by 6 by 2 inches. The cross members, G, are 5 feet 3 inches long by 6 by 2 inches, and are connected to the side members as shown in view C and D. There are four stock ball-bearing rollers, H, with a 3-inch wheel attached to the four corners, I, of the turntable. These rollers act as legs or supports and assist in the operation. The pivot or center bearing is made up from two pipe flanges, J and K. Flange J is bolted to the center member, G, by four bolts. Flange K is bolted to the floor of the garage. A 2-inch pipe, L, is held

Digitized by Google

secure in flange, K, by a bolt, M, while the other end of the pipe is loose to revolve in the flange, J, when turning the turntable. The bolts that connect the cross members to the side members are countersunk in the top surface of the turntable, so not to interfere with the tires of the car. Block N, shown in dotted lines, are blocks of wood cut from timber 8 by 6 inches. They are made wedge shape and are 2 feet 4 inches long. The blocks can be placed at the end of the turntable when the car is to be placed thereon, and removed when not in use. This design of turntable can be moved and placed against the wall of the garage whenever necessary, and the flange K, with the pipe L, can be easily removed from the floor by removing the four bolts. This turntable can be built at a very low cost, and will be found useful. When your car enters the garage head-on and runs on the turntable, it can be turned to go out front first.

RIVET REPAIRS.

Driving Them In and the Method Known as Backing Them In.

BY JAMES F. HOBART, M. E.

On page 38 of the August issue, Mr. J. N. Bagley makes some pertinent and interesting remarks regarding the driving of rivets and his advice may well be followed by mechanics in doing both old and new work. In driving rivets, particularly in rather light material, such as is used in automobile work, I have a great liking for the method of riveting known as "backing them in."

Fig. 1 shows this method. The two vertical plates to be riveted together, are drilled in the usual manner as shown at A, with the rivets a little smaller than the hole, placed in position as shown at B. For hot riveting, the hole should be about 1/16 in. larger than the rivet, but for cold riveting, the holes may be just as much larger than the rivets as will let them slide into the holes. Usually, ¼ inch rivets, to be driven cold, are made just small enough to slide easily through a ¼ inch hole, therefore nothing may be allowed for extra size of the hole, but in hot riveting, a size smaller (1/16 in.) rivet is used than the diameter of the rivet hole. Thus far the work is the same as in regular riveting, but now, instead of "holding on" to the head of the rivet, the dolly is applied to the point of the rivet as shown at C, and all the driving is done upon the head of the rivet. In this engraving, a button set is shown at D, fitting the head of the rivet as shown by the dotted line E. Force is applied by means of the hammer F, to drive the set against the rivet head.

The force of the hammer blow is transmitted through the set D, into the rivet B, which, being unable to move because of the mass of metal in the dolly C, the rivet is enlarged or upset. The metal, being unable to move endwise, flows sidewise as shown at G, forming a sort of head. But the metal in the rivet flows sidewise at A, as well as at B, and fills the hole A completely. At the same time, a portion of the hammer blow force is expended in forcing the plate N in the direction of the rivet movement. This brings the plate N into very close contact with plate O, which is very desirable. But plate O is prevented from moving freely sidewise by the partial rivet head G, therefore each hammer blow has a tendency to bring the plates closer and closer together and to hold them there.

When ordinary riveting is done, the proceeding is as shown by Fig. 2, the plates P and Q, not being affected very much by the hammer blows, at least not until after the head S has attained a considerable size. At the beginning of the riveting operation, the first effect of the blows is to drive the rivet back through plates P and Q, their inertia holding them

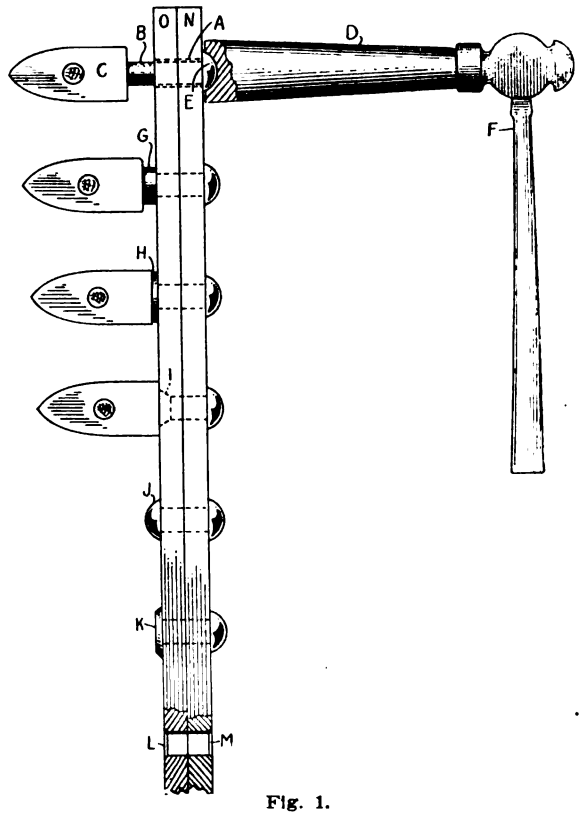


Fig. 1.

stationary while the rivet is driven backward until the force of the blow is absorbed in upsetting the rivet S, and in a slight recoil of the dolly R.

In this method of riveting there is always a tendency to drive the plates apart instead of driving them closer together. The tendency is also to drive the rivet out of the plate instead of farther into it. And there is a further inclination to drive the rivet through the head which is being formed. In fact, to shear off that portion of the head which overlaps the plate around the rivet hole.

All the power there is, to bring the plates together, when riveting as in Fig. 2, is that portion of the hammer force which upsets the rivet and enables the head to flow out around the rivet in spite of the tendency to be driven out through the rivet hole. It seems, by this way of riveting, that the rivet head is being made under the most adverse conditions imaginable. It is much like pulling a rod upward through a hole in the floor, where every new hold for the hands must be obtained by giving the rod a quick upward heave, letting go and catching it again before it can drop back as far as the last heave threw it upward. But with the "backing-in" method, the conditions are altogether different. The plates are directly driven together by the hammer blows. The rivet is directly compressed or upset and the recoil of the dolly does no harm, for whatever reactions took place in the rivet or in the plates, were completed before the impulse reached the dolly.

In making the various styles of rivet heads, the same thing holds true and the backing-in method

Digitized by Google

remains far ahead of the other way. Thus in making the thin, almost flush head, as at H, this method is extremely good for there is no reactionary stresses placed upon the thin head as would be the case were the rivets "driven-in."

In making the countersunk head as shown at I, every possible bit of plate closing and rivet driving power is made use of and the expanded countersunk head seems to hold all the slack that can be gained by driving upon the head of the rivet—something which is not as easily accomplished when driving-in the rivets. It is easy to obtain a full round head by the backing-in method and J shows a rivet which has been formed by holding against it, during the driving, a dolly which had its face formed into a die the shape of a button head.

At K, there is shown the effect which may be obtained by giving the dolly-face the necessary shape, but in driving these last two shapes of head, there is always a bit of uncertainty as to whether the rivet will be tight or not, after it has been driven. Should the rivet be the least bit too short, then the dolly, or the set, whichever was used, would come against the plate and the rivet cannot be driven tight, no matter how much hammering may be done upon the rivet. Therefore, it is necessary to leave the rivet blanks just a trifle too long so the set or the dolly can never reach the plate. This is what causes the double line along the bottom of head, J. If the blank be too long, this base will be so large as to be unsightly. But when the length of rivet is just right, the head will look as though there were a thin washer underneath it, and the washer will be but a trifle larger in diameter than the base of the rivet head.

In most repair riveting, there is more demanded from rivets than when they are placed in new work, therefore they should be given every chance possible that they may do their work well. One thing, which is often overlooked in riveting, is to see that the

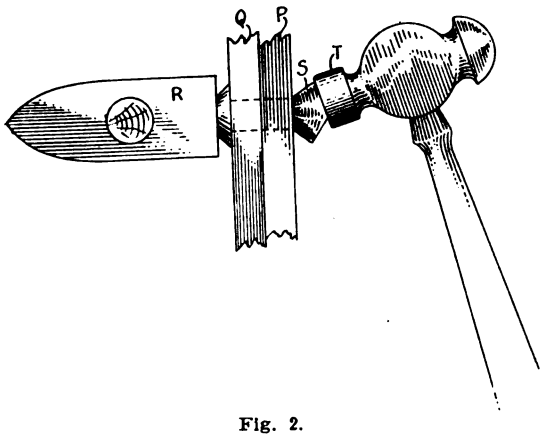

Fig. 2.

holes in the plate have the sharp outer corners removed. When the corners are left sharp as at A, there is every inducement for the rivet head to be sheared off by external stress, or to fly off under internal strain.

Rivets are often cut out of a seam by striking the side of each head with a sledge hammer which has a very sharp corner. The rivets placed in holes with sharp corners, come off very easily under the blows of a sledge in the hands of an experienced man, but where the sharp corners have been taken off around the holes, it is much harder to remove the rivet heads in this manner.

Fig. 1 shows at L and M the manner in which outer sharp corners should be removed from all rivet holes. A reamer, a drill, or a countersink has been run into the end of each hole and the slightest possible corner removed. The face left need not be more than 1/64 in. or 1/32 in. wide, in order to greatly strengthen the rivet at its weakest point, or where the head joins the body. By slightly chamfering the corner of the plate, the rivet is given a corresponding fillet which greatly increases not only the holding power of the rivet but the drawing together power also. A rivet driven in a hole with the sharp corner removed, can pull the plates together with much more force than is possible in a rivet driven into a hole where the sharp corners have been left on.

When it is necessary to rivet a thin cast iron section to steel, then there is a chance of breaking the casing by the uneven drawing power of the rivets. When the rivets are backed in, there is much less danger of breaking the cast iron than when they are driven in the usual manner.

PAINTING A FORD CAR.

It Requires Knowledge, Patience, Care and Considsiderable Time.

From J. M. Freeman, Maine.—Will you please tell me in your next issue how to paint a Ford car?

Reply.—The work of painting the car may be divided into three general classes, these consisting of touching up and varnishing, painting the chassis and varnishing the body, and the burn-off job. The first named consists of matching the colors and touching up of the places from which the paint has been displaced. If the original Ford color, black, is to be selected it is easily matched. Brighter colors are more difficult. If the paint be badly checked or flaky it will have to be removed. Do not attempt to use the torch unless familiar with it as the wood is likely to be burned. The easiest method is to employ a chemical remover, a fluid that is applied with a brush and which so softens the paint that it can be scraped off with a putty knife.

Remove the body from the chassis and place it on stands or barrels of convenient height. If the old paint be removed, go over the surface with No. 1½ sandpaper and finish with No. 0. The surface must be as smooth as glass before applying the first priming coat which fills the pores, sealing them against moisture and affording an elastic ground for the remaining coats. A primer for wood is made of white keg lead and raw linseed oil slightly colored, or ground white lead and turpenntine with a coloring pigment. Use about one part oil to six of turpentine and apply with a two-inch ox hair brush. Allow four or five days before applying the second coat. For metal bodies use a prepared primer or make one by mixing three parts turpentine, two parts raw linseed oil and add a teaspoonful of pale drying japan to each pint of the mixture. Apply with a soft round or oval bristle brush and allow at least 24 hours for drying. Before applying the priming coat, clean the metal thoroughly with benzine.

The next step is puttying and glazing the cracks, pores, etc. Mix equal parts of dry white lead, japan and rubbing varnish, and when smoothing out with the knife be careful not to cut or gouge the priming coat. Allow the putty to become hard and then smooth with No. 0 sandpaper. The use of rough

Digitized by Google

stuff is not generally considered necessary with metal bodies.

Several coats of rough stuff are applied with wood bodies. Rough stuff can be purchased ready mixed and thinned down to a consistency slightly heavier than ordinary paint for brushing. It can be made by taking American dry filler and white keg lead, equal parts by weight and making a thick paste by adding equal parts of japan and rubbing varnish, thinning with turpentine. The coat is applied lengthwise of the panel, and the paint brushed out quickly and evenly. The second coat is applied across the panel and the others in an alternate direction. From four to five coats are generally applied and at least 24 hours should elapse between each coat.

The next coat is termed the guide coat because it is rubbed off when obtaining the level surface. It is made of rough stuff colored with yellow ochre and thinned with turpentine. The rubbing process is performed with a brick of rotten stone or pumice and the stone must have a true surface. Fill a pail with water and dip the stone into it from time to time. Wash off the surface with a sponge, and in rubbing use a steady, straight out and return movement. Keep the surface well supplied with water and do not use too much pressure. Remove the guide coat but do not cut too deeply into the coats of rough stuff. Wash carefully and allow 24 hours to elapse before sandpapering with No. 00 paper.

Dust the body very carefully before applying the groundwork. The selection of the color requires careful consideration as some tints are difficult to apply; in fact, many professional painters are unable to apply certain colors with success. Dark colors such as Brewster green, black and dark browns are easily applied and cover well. The number of coats will depend upon the color and any dealer in paints will advise as to the number required. It is important that the colors be allowed to dry hard and 24 hours is a safe rule. Two-inch camel hair or mottler brushes are employed.

Following the color coats come two of color varnish and two or three of rubbing. The varnish comes ready for use and its makers supply complete directions as to the time required for it to harden properly. The surfacing or rubbing of varnish requires experience but a sufficient knowledge of the work may be obtained by visiting some paint shop and watching the operation. A practice indulged in by some owners who paint their cars is to apply the rubbing varnish and engage some painter to do the rubbing and final varnishing. Generally such an arrangement can be made with a painter to do the work on his spare time. This will assure a good job and the owner can learn how the work is accomplished.

For rubbing varnish one will require two clean pails filled with soft water to which a little soda is added, some good sponges, chamois, rubbing pads and a small quantity of 0 or 00 pulverized pumice. The pads come in varying sizes and thicknesses. Dip the pad in water, then into the pumice and apply to the surface. Rub lightly at first and in one direction. Use the sponge and plenty of water to remove the pumice from the surface and be careful not to cut through the varnish. The object of the rubbing is to provide a foundation for the following coat and to make it grip. After completing the rubbing, wash thoroughly and chamois the surface. This is important. The final coat of rubbing need not be rubbed as thoroughly as the preceding coats.

In applying the final coat or finishing varnish, it like the preceding coats should be flowed on, not painted. Apply the varnish liberally, then wipe up the surplus with the brush. Draw the brush over the edge of the varnish cup to remove the surplus. The coat must be uniform and not so thick that it will run and form little ridges or hills. The final coat should be allowed to stand at least a week and the temperature of the drying room should be even and warm. It should be borne in mind that varnish hardens from the outside.

All dirt and grease must be removed from the chassis before painting else a condition known as pitting will result. Clean with gasoline, then wash thoroughly, using plenty of water. Allow the paint to dry before sandpapering. Dust very carefully before applying the coat of lead which is made up of three parts white keg lead, one part raw linseed oil, four parts turpentine and a little lampblack to obtain a light gray color. This coat will dry in 24 hours after which it is puttied and glazed as with the body. Allow 24 hours to elapse, then sandpaper and apply the color. Generally one coat of color varnish and one of rubbing varnish will suffice before the final coat. Striping is done after the final coat of rubbing and will require the services of the professional.

The room in which the painting is done should be well lighted and heated and free from dust. The northeast corner of the building is preferable, and before applying the varnish the temperature of the room should be at least 80 degrees. The varnish and body or chassis should be warm. Place the varnish near the source of heat and have it thoroughly warm so that it will flow easily. Do not allow anyone except yourself in the room when varnishing and move cautiously so not to stir up any existing dust.

After completing the work do not be anxious to note if the varnish be dry by placing the finger or hand on it. More or less oil secretions will be deposited and absorbed by the varnish, ruining the finish. If you must test for hardness, use the back of the hand and be sure it is clean. Do not be in too great a hurry to place the car in service and avoid taking it out on muddy days during the first few days of use if you would avoid spotting. Spotting is caused by capillary attraction of the drv mud extracting the oil from the varnish. City mud is full of ammonia, destructive to the luster of the varnish. Do not be disappointed if after completing a touch up and varnish job that it appears to be full of fine cracks. Varnish will not fill these indentations which are largely due to the paint being cracked. Do not attempt to hasten the drying of the varnish by spraying with cold water as it only hardens the outside and the varnish is likely to soften again when exposed to the sun.

Drive on the Throttle.

Slow down when possible by means of the throttle, and not by means of the brakes. If you keep your eyes open, and do not rush wildly along the roads, you will hardly ever have to touch your brakes, inasmuch as the opening and closing of the throttle will regulate your speed. Use of the brakes means wear and tear of mechanism and tires; use of the throttle means gentle action.

ELECTRIC STARTING SYSTEMS.

Their Care and Upkeep and Why They Often Fail to Do Their Work.

From J. N. Bagley, Nebraska.—With a low test of gasoline, cold weather, etc., car cranking is a little difficult under normal conditions, and where the engine requires an unusual amount of cranking the draw on the storage battery is such that it is but a short time until it will fail to start the car. To begin with, the car should not be cranked with the starter on a cold, raw morning, but the hand crank should be used instead, for most people do not do much pleasure driving in bad cold weather and the amount of driving for business in most cases is not sufficient to keep the battery in prime condition. For instance, Brown uses his car to drive a mile to his business and leaves it stand the balance of the day in the cold. It will start hard and the amount of current taken from the battery to start will more than offset the current placed back into the battery in the mile or so driving. The result is in a very short time the battery is exhausted. Now Brown drives the car to the service station and is advised that the battery is in a run down condition and at this time he begins to condemn the starting system, when he himself was to blame. He should give a little time to the study of the system and the limit of its usefulness.

The writer has known of batteries standing up and doing good service for two continuous years

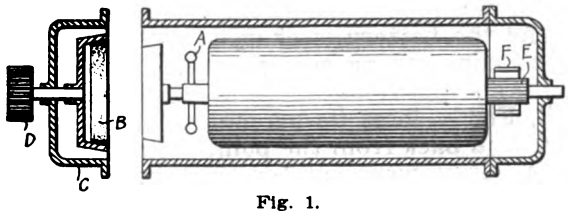

Fig. 1.

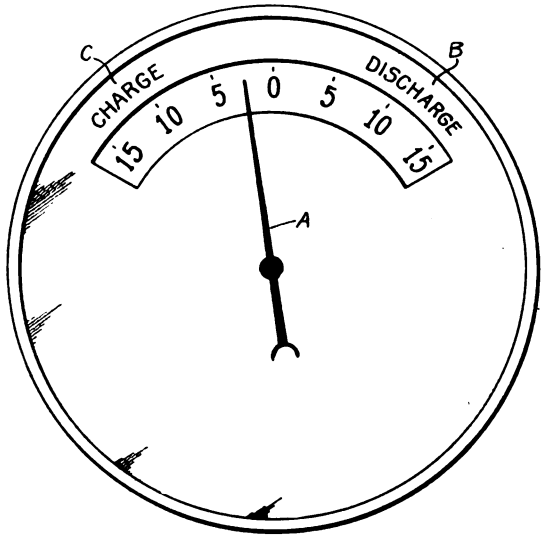
without ever being removed from the car. This was not due to any particular make of battery, but simply a matter of the owner caring for the battery as well as the system. This man never uses his starter on a cold morning but instead has a can of gas which he uses to prime the engine before cranking by hand. Then, again, when he is not using the car in cold weather he goes out two or three times a week and cranks the motor and lets it run to recruit the battery. Once every week he examines the solution in the battery to ascertain if the plates are well covered, and if they are not he has a small supply to add to it. This fellow has success with his battery and when spring comes it works as well as when it went into winter, while his neighbor must spend some of his hard-earned cash for a new battery before he can use his starting and lighting system. The generator and the starting motor should be taken from the car before cold weather begins and the two machines carefully cleaned and overhauled by a competent repair man, as this will add much to the long life and satisfaction of the system. During the summer months when the roads are dusty quite a little dust will find its way to the different delicate parts and this should be removed not less than once a season.

Every generator should be kept in such condition that it generates when the engine is running, and to do this there are a few things which should be looked to occasionally. In Fig. 1 we have a generator which is supplied with a clutch, B. This clutch is necessary to allow the regulation of speed, as the governor, A, disconnects the driving member from the driven. At D we have the driving sprocket which drives the machine, but as the speed increases to such an extent that the amperage would be too



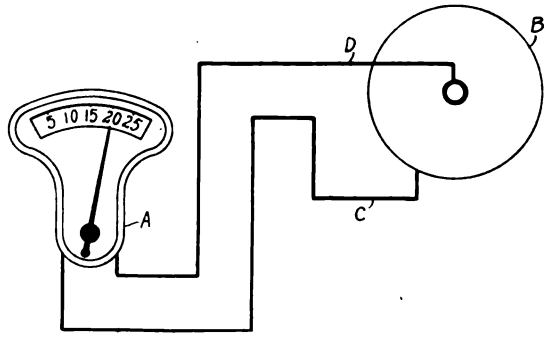


Fig. 2.

high for the battery, the balls, A, release the pressure on the lined plate, B, and the driven member, E, slows up and remains so until the speed of the engine drops to normal, when it again begins to drive. This lining on the clutch, B, should be replaced with a new one every season at least, for when it gets worn close it is a difficult matter to control the output of the generator. The speed at which the ball governor, A, will work will depend on the adjustment of the governor back and forth on the shaft to which it is fastened, as this is the adjustment which controls the output of the generator to the battery. This fact is known by the ammeter on the dash. The brushes, F, should be cleaned occasionally and replaced with new if necessary as they collect the current and through the wires fastened to them it is conveyed to the battery.

Around the entire working parts is a cast iron shell, C, which should be cleaned occasionally as dirt collects inside and will get into the governor as well as the brushes. This will aid in cutting the commutator, E, and it will be necessary to have it trued up in the lathe. The commutator is made up of segments of copper insulated from one another with mica and in case it is turned in a lathe, care should be taken that none of the metal from one segment connects the segment next to it, and to make sure that none of the metal remains, go carefully over

Digitized by Google

each insulation partition and clean it thoroughly. In case one is not familiar with the workings of the generator it is a good plan to take it to some one who understands it, and in case there is no one in the immediate vicinity capable of doing the work it is a good plan to send it to the nearest service station. In case the latter is done, make a diagram of the connection so that in replacing the generator all wires will be in place.

In order to know what the generator is doing the little ammeter on the dash can be consulted and note the reading when the engine is running. When the car is running very slow the generator will not generate current enough to operate the relay, consequently the ammeter will not show anything, but as the engine is speeded up to say a speed of about 8 to 10 miles an hour, the indicating hand, A, in Fig. 2, should show about 8 amperes on the charge side, C, of the instrument, and as the speed is increased to say 20 miles it should show about 15. As the speed of the car is increased to say 30 miles, the hand should not read off the board, but if it does the charging rate is too high and the governor should be released a trifle and the same test repeated. Now with all the lights turned on and the car running at a speed of say 15 miles to the hour the ammeter

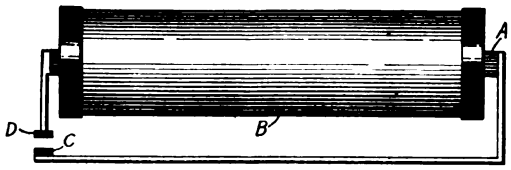

Fig. 4.

should still read on the charge side about 5 amperes, but when the car stops and the lights are still on, the hand, A, will change sides and read from 7 to 10 on the discharge side, B, of the instrument. In case the ammeter would read to the discharge as soon as the motor was started it would indicate that the wires on the back of the instrument need changing, as many times happens in replacing the wiring.

Now in case one of the lights fails to light there are but few things that could be out of order, as shown in Fig. 3. The bulb might be burnt out or a fuse blown, and in either case it is an easy matter to tell. Take an ammeter or a voltmeter, and remove the bulb from the setting, D, in the reflector, B, attach wires from the instrument and note if the current is coming up to the contact point at the reflector. In case the instrument, A, shows that the current comes up the trouble is with the socket or the lamp bulb. Try a new lamp as a first resort, and in case it still does not light examine the contacts that bear against those on the lamp. The wires, D, C, can be placed to correspond to the wiring system as shown. In case no current comes to the socket, take wires, D, C, and go to the fuse block and test the fuse. Do not test the storage battery with the ammeter as the ordinary ammeter would be worthless the instant the connection was made as the amperage of the battery is very high. To test the storage battery the proper instrument to use is the hydrometer, which will show the density of the solution, and by the test of the solution the exact condition of the battery can be had at all times. When the battery is fully charged it will give a reading of about 1,350, and when it is in a run-down condition it will show a reading of 1,100 or less. The battery should not be allowed to stand in a run-down condition as it will prove injurious to the plates. As soon as the battery shows a weakness it is a wise plan to have it charged and the generator examined to see that it is giving the proper current to the battery. In case the battery is in a good healthy condition and it needs charging it can be charged with the generator very quickly if the generator is working, by not using the starter for a time and the lights very sparingly. Batteries are all good batteries when given a fair chance, but any

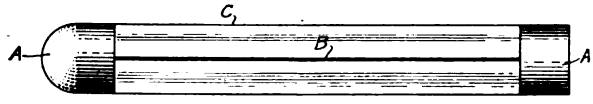

Fig. 5.

battery abused will give unsatisfactory service no matter on what car it is placed.

The "relay," as we call it, or some may call it the magnet cut-out, or magnetic regulator, is a little device which cuts out and in the current from the generator to the battery. For instance, if the generator is not running fast enough to give a current stronger than that already in the battery there would be little gained by connecting, as the current would flow in the opposite direction and the battery would be run down instead of being built up. This instrument fills this gap and when the generator has speed sufficient to offset the stored up current in the battery, the core of the little coil becomes magnetized, pulling the arm over which closes the circuit and the battery is charged so long as the current remains strong enough to keep the points intact. As soon as the speed drops down the core in coil B, Fig. 4, loses its magnetism at A, letting the arm, C, fall back from the point, D, and the circuit is broken. If it were not for this the current stored would all flow back through the generator as soon as the machine was stopped and in a very short time the battery would be exhausted. The regulator coil, B, carries the armature current and through this winding the core around which it is wound controls the flow to the battery.

The fuse shown in Fig. 5 is a little tube containing a thread of soft metal and in case a direct short

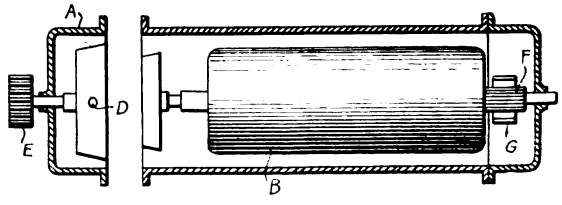

Fig. 6.

would occur in the system the heat would melt the little metal thread and break the connection and stop the flow until the trouble could be remedied. If it were not for this fuse some part of the winding in the generator would very likely be burned up and possibly necessitate a very expensive repair. One should always have at hand a quantity of fuse wire and never use any old wire or the entire system may be ruined. This, Fig. 5, consists of a small transparent tube through which fuse wire, B, is passed and made secure to the two ends, A, and these ends in turn are made fast to the wires leading from the battery to the light, etc. When a fuse is melted it

Digitized by Google

can be seen through the transparent tube, C, as usually they are blackened to some extent.

In Fig. 6 we have a generator very similar to the one described in Fig. 1, save the governor, which is adjusted through the hold of the clutch plate, D, and can be adjusted without taking the machine apart. The driving sprocket, E, is exactly the same, and the parts, B, G, F, are constructed alike and the entire machine is enclosed in a metal shell, A. The clutch cover, A, can be removed from the main frame to repair the governor or clutch without dismantling the machine, or the back part of the shell can be removed to get at the brushes or clean the commutator, F, which should be done occasionally. There are many makes of generators but all are constructed along principles described and are easily understood.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

1729 Carburetor Trouble.

From Alvin P. Kraetsch, Wisconsin.—I have a little trouble with my Imperial automobile. In running idle it pops in the exhaust, but in pulling it doesn't miss or pop in the exhaust pipe. When I have run idle for a time and then stop the engine, it seems that the carburetor is choked with gasoline. If I cut down the gasoline so that the car runs smoothly when running idle, then it will miss in pulling. What is the trouble?

Reply.—Popping in the exhaust is a result of missed explosions, caused by imperfect carburetion or ignition. If the mixture is too rich the exhaust will be very smoky. Too lean a mixture may be caused by air leaks between the inlet valve stems and their guides, these leaks not affecting ordinary running, but when the throttle is nearly closed as when idling sufficient air may enter there, or even around the butterfly throttle valve stem to reduce the velocity of the air through the fixed air passage past the vaporizing nozzle to such a point that the air does not completely vaporize or pulverize the heavy gasoline. The result in such cases is that the mixture is too lean until a considerable amount of fuel accumulates in the inlet manifold, and then is drawn into the cylinders in excessive amounts. Too large a carburetor, or one whose fixed air opening is perhaps of the proper area for the motor when new, or when using much lighter gasoline than now commonly procurable, would give you similar results to what you are now expriencing, and in addition would also cause hard starting. We are considerably handicapped in replying to this inquiry not knowing the make and model of your carburetor, or the year's model of your car.

1730 Three Good Questions.

From Wm. Wilson, Illinois.—1—Is it true that a Ford motor will run from five to ten revolutions on a prime? That is to say, the gasoline being shut off, the carburetor not feeding any gas whatever. I always thought that any gas in a cylinder, regardless of amount, would all explode on the first firing point, but perhaps I'm wrong. 2—Why is it that kerosene is not recommended for winter use in the cooling system exclusively? I have been asked that question and see no reason whatever why it could not be used, but I thought it better to consult more learned individuals before recommending. 3—The pressure in the tires should be increased as the weather grows colder should it not?

Reply.—1—There is always more or less gasoline in the float chamber of the carburetor and with this to help the priming charge such results as you describe would not be unusual. With all four cylinders primed and the mixture fairly perfect it would take two complete revolutions before all cylinders would have an opportunity to fire, and with these explosions occurring regularly during two revolutions it would not be unusual for the engine to make several more before stopping. If again the mixture were too rich in say, two cylinders, it should be possible to get two revolutions or more from explosions in two cylinders and more revolutions from explosions in the others when the mixture gets sufficient air to explode therein. 2—Kerosene has too low a boiling point, for one principal reason. For another it would soon dissolve the rubber hose connections to the radiator. 3—Temperature changes necessitate very slight, if any, variations in tire pressures. Our advice is for you to follow absolutely the suggestions of the manufacturers of your tires.

1731 No Known Injury.

From C. F. Showalter, Iowa.—I have a Cadillac, 1912 model, and wish to know if there is any danger to the car to run it after the battery has been taken off. There seems to be a difference of opinion in this regard.

Reply.—We do not know of any possible danger of injury to the car or motor as a direct result of running with the storage battery removed.

1732 A Metallic Click.

From E. C. Thompson, Kansas.—I own a Glide 36-42, 1914 model. It has a model L Schebler carburetor and a Westinghouse electric ignition, lighting and starting system, with generator and storage battery. It runs very well, but it has for some time developed a kind of metallic click in one cylinder, and at rare occasions in two cylinders, but only when the gasoline feed is half or more than half open and the engine is on a pull. If I lessen the feed or open it wide, it stops the click, but it also lessens the power of the engine. Will it damage the engine or give bad results? I have examined the pistons and rings and the engine in general. In fact, the engine runs very nice and smooth otherwise. Please give cause as well as remedy.

Reply.—The slight click may be the result of what is known as a piston slap, or it may be due to pre-

Digitized by Google

ignition. Unless it grows worse this symptom should not alarm you. If you desire to cure it you will first have to locate it definitely, and if found to result from a piston slap you should have a new piston in this cylinder. A physician's stethoscope is frequently used to discover in which cylinder a click occurs. Shortcircuiting the plugs, one after the other, will sometimes locate the troublesome cylinder.

1733 **Several and Sundry Inquiries.**

From Roy R. Kiefer, Indiana.—1—Do you advise the use of shock absorbers? 2—What do you mean by the priming pin? 3—Which rims cut the tires most, common clincher or straight edge? 4—Do you advise the use of Neverleak piston rings? 5—Is there a body oil or polish on the market that will not spoil the paint and glossy finish, but preserve it? If there is, name the one you prefer. 6—Does a valve-in-the-head motor give more power than an engine with an L head motor? 7—If it does how much of each is called 40 H. P.? Here is a question concerning which please give me all the advice and information you can: 8—Do you advise the use of iron clasps to cover a tire? 9—Will they preserve the tire to a great extent? 10—Does a tire covered with steel ride as easily, or about as easy, as without the steel cover? 11—Do they make any annoying noise when on a pavement? 12—Do they skid and slide more than a rubber tire? 13—Will they rust and rot or spoil the outer casing? 14—Does a tire covered with steel absorb the road shock as well, or about as well, as without steel cover? 15—Do you advise them for rough country roads, or rough pavements? 16—If you don't advise the steel cover, tell me of one you prefer. 17—What is the cause of an automobile running in a ditch, or side of the road, when running over a dog? Is it that the driver doesn't hold the wheel fast enough, or would it do the same if he held his wheel in the same position? 18—Please explain fully. 19—Is the Silent Knight motor, which the Overland Company use, a success? Do they last as long as with the common valves? 20—Can you tell me how much horsepower Ralph De Palma's German Mercedes Special was, which he used at the last 500 mile race at Indianapolis? 21—Which make and whose auto racer had the greatest horsepower at the last 500 mile race at Indianapolis and how many H. P. was it? 22—What size tires should a car have weighing 3,100 pounds without passengers? 23—Is the Eagle Macomber motor, which is a rotating motor made by the Eagle-Macomber Car Co., Chicago, Ill., a success? 24—Is it a long-lived motor and powerful for its size? 25—Do you think it safe and profitable to invest for shares in that company? 26—Do you think their rotary motor gives as good or better service as a common motor? If not, explain why. 27—Does the Ford Motor Car Co. make a tractor with the same style and type engine as they use in their automobile? 28—How many H. P. is the Ford tractor and what is the price of it?

Reply.—1—It depends upon the car, the use to which it is put, and the roads over which it must travel. We advise their use in most cases. 2—Sometimes it means a small rod for pushing the carburetor float down to admit more gasoline. 3—We should say the clincher, although neither will cut the tire if it be properly inflated. 4—Yes, we favor piston rings that do not leak. 5—Yes, there are several. If we were to mention the one we prefer it might be an injury to some other one just as good. 6—Valves are placed in the cylinders in various ways and in various places, and this is fairly conclusive proof that engineers do not agree as to which position is best. Valves in the head are usually considered among the best. 7—We don't quite understand you. 8—Yes, for some uses on the ground of economy. 9—Yes. 10—No. 11—Not annoying to those who possess normal nerves. 12—No. 13—No. 14—No. 15—Yes, if long wear of tires is the object. 16—The one you refer to is a good one. 17 and 18—The dog being a somewhat lively animal until the wheel has passed over him, he sometimes pulls one way and sometimes another, and this may have more effect on the car than if the dog were a dead weight, but if the driver holds his wheel fast enough he will not necessarily run into the ditch. 19—Yes, to both questions, may be a good answer for a brief one. 20—The horsepower is uncertain; the cylinder displacement was 270.9 cubic inches. 21—The Dusenburg had the greatest cylinder displacement or 299 cubic inches, and one car in that race had an engine of but 103 cubic inches. 22—Four and one-half inches. 23—We have no reason to doubt it but it might be a good idea for you to write to the manufacturers themselves for further information. 24—We do not know. 25—We could not say. 26—This can be answered like the other two we are unable to answer. 27—No, not yet. 28—It is not yet announced.

1734 **A Missing Cylinder.**

From O. M., Missouri.—I have a 1914 Model Ford. The car has run about 10,000 miles, but I have run the machine only about 1,000 miles. I am having trouble with cylinder No. 2. At times it misses badly. Then if I take out the spark plug and clean it, it works fine again for 50 or 75 miles. Then I have the same trouble again. I put in a new spark plug and used the old one again, but the trouble remains. Now what do you think is at fault? Some tell me that there might be a broken piston ring. Others say that cannot be the case because the compression seems about alike in all four cylinders. Some tell me a Mosler Spit-Fire spark plug would cure the evil. Some tell me the trouble is in the coil unit, and I am inclined to believe that the latter is the cause of the trouble. I have taken out that coil unit and one of the other ones and connected each one with a dry battery, but the vibrators of No. 2 will not hum as keenly as those of another unit. If the coil unit is at fault how can it be remedied?

Reply.—If missing explosions in the number two cylinder can be cured by cleaning the spark plug we should consider it conclusive evidence that the spark coil unit for that cylinder was in proper working condition. If any further evidence were desired we would change the units, wiring the number two unit to ignite number three. You could easily change the units if of the removable unit type, or you could simply change the two primary coil connections at the same time changing the connections of the two secondary wires to the plugs. You understand that this changing should be the same both in the wires from the timer to the coil and from the coil to the plugs. If the missing is due to oil leaking past the piston in this cylinder, as it most probably is, it is caused by broken or worn piston rings, a badly worn or poorly fitting piston or a scored cylinder. If the

Digitized by Google

last you may have to have this cylinder reground and a new piston and rings fitted. If you decide to try new spark plugs be sure and get Ford type, rather than the regular construction. You will probably have to take the engine apart to discover the cause of the trouble.

1735 **Valve Trouble.**

From C. A. Walter, Kansas.—1—We have a Hupmobile, 40 H. P., which has been driven 5,000 miles. It is a 1915 model, bought in June, 1915. About a month ago it was driven 40 miles through the mud and came in missing on one cylinder. After going over all the wiring and plugs, I found the trouble in one of the valves. One of the push rods had gotten so tight that the valve wouldn't close. In changing it I found the lock nuts perfectly tight and they didn't look as if they had ever moved. Last week the trouble came back but in two push rods this time and they were also tight. Now I would like to ask if you can explain this trouble. I have seen valves get loose and cause trouble but I never saw them get tight before, and especially on a new car. I am sure the push rods didn't lengthen, but what else could have caused it. 2—Please state in your next number the non-freezing of calcium chloride in the evaporation. Does the calcium chloride evaporate faster than water like alcohol, and in the adding of lost solution, what portion should be added.

Reply.—1—The push rods of course cannot lengthen, and it is a rare thing for the lock and adjusting nuts to loosen. Exhaust valve stems do lengthen when they are hot, and the valves themselves do wear and pound down into their seats, bringing the end of the valve stems closer to the adjusting nuts. If you will go over your valves when the engine is hot you will be able to observe that adjustments have to be made occasionally. There should be the thickness of a visiting card between the valve stem ends and the adjustment nuts when the motor is hot. 2—Add rain water only to replace that lost from evaporation, and water and calcium chloride to replace any which leaks out, using the same proportion as when the radiator was originally filled. The calcium chloride does not evaporate. It also increases the boiling point, while alcohol reduces it.

1736 **The Cadillac 8.**

From Chas. F. Isola, New Hampshire.—1—I would like to know if the generator in the Cadillac, 8-cylinder, model 1915 car, gives a direct or alternating current. 2—Do all dynamos and generators give a direct or alternating current? 3—Is it the way they are wired which makes them give either a direct or alternating current? 4—Is the starting motor and generator combined or are they separate systems in the 1915, 8-cylinder, Cadillac? 5—How is question 4 wired, if they are not separate systems? 6—I was told, at one time, that there was an automobile school in New York, or somewhere, which admits scholars to their garage and gives them actual practice in machine and garage work. Do you have in mind any such school? 7—What are the best spark plugs to use in the Cadillac 1915, 8-cylinder car? 8—Would porcelain plugs be better than this material, which will not crack quickly from the heat, such as the Bosch plugs are made of?

Reply.—1—Direct. All generators used for combined starting and lighting, or starting, lighting and ignition, in which current is sometimes furnished from electrc accumulators or so-called storage batteries, are of the direct current type. 2—Every dynamo, generator or magneto has necessarily to be either of the alternating or direct type. 3—It is not the method of wiring which distinguishes one type from the other, but the method of design and construction. All direct current magnetos, or generators have commutators and brushes, while alternating current machines use stationary windings and rotors which alternate the current flow four times during each complete revolution of the rotor, or have shuttle or H-shaped wound armatures which give two alternations during each complete revolution of the armature. Direct current machines give or use the current always in the same direction while one-half the time the flow is in one direction and one-half in the opposite. 4—They are two entirely separate units. 5—In systems operating with a single unit the three-cell battery containers are wired in series for charging, and in parallel for operating the generator as a motor. The double unit system employs less battery than the single unit. 6—There are schools which advertise this feature, but we do not know how much experience and actual practice is permitted. Owners of cars could hardly wish to have amateurs make repairs. We would hardly care to recommend any school advertising this feature without first satisfying ourselves that real practice is permitted, and to what extent. While it takes several years to educate a machinist, we hardly see how an efficient mechanician could be produced in a few weeks with no previous mechanical instruction and training. 7—It is to be presumed that the spark plugs furnished with the car are selected by the Cadillac Motor Car Co. as the very best for the ignition they use, which is manufactured for them by the Dayton Electrical Manufacturing Co., Dayton, Ohio. 8—If the plugs you are using are not giving satisfaction we advise that you take the matter up with your local Cadillac agent. The ignition of the Cadillac is by battery and not by magneto. Bosch plugs are designed for magneto ignition.

1737 **Car Slows Down or Stops.**

From S. B. Myers, Pennsylvania.—I have a car E. M. F., 1912, model Flanders 20. It has given me good service until of late it starts hard, and when it does run it will run for about a half a minute, then it will slow down and stop. When I crank it up the second time it will run O. K. It does this just in the morning when I first start it. 2—Of late it has a kind of slapping noise, worse on low gear, and some on second and high. I had the engine apart, put in eight new piston rings, cleaned out all carbon, and examined the other piston rings. The piston rings appeared all O. K., the cylinders appeared good and were not scratched. When first starting the engine the motor will cause explosion or back firing for three or four times, then that will be the last until the next morning. It does not have the pulling power to do it. Should I put in all new rings. The rings are not worn that I can see.

Reply.—1—Your motor has probably the original carburetor, one designed to properly vaporize the much lighter and more easily vaporized gasoline of three or four years ago. If this is the case you should purchase a carburetor of later model, one that

Digitized by Google

gives you a higher velocity of the air past the vaporizing nozzle. It is also likely that air leaks have developed between the inlet valve stems and their guides, and possibly around the carburetor throttle lever, any such leak reducing the vacuum at the carburetor and lessening the air velocity. 2—The back firing on starting shows too weak a mixture, and is but another symptom of air leaks and insufficient air velocity through the carburetor.

1738 **Car Lacks Power.**

From G. H. Kaiser, Tennessee.—I have a 1912 model five passenger Hudson car which has been running well until about last May. Since then I have had a good deal of trouble with it, and the shop man seems to be unable to find the trouble except that the car was very dirty and cleaned it out some three or four times. Finally I suggested to him that I believed it was the carburetor or the magneto. He changed and repaired the magneto which seemed to help the car but I have been unable to get more than six or seven miles out of a gallon of gasoline. I told him of this trouble and he then worked on the feed valve which he said was too large. He then put in a smaller one and the car is giving no better satisfaction in that respect. It runs some better, does not clog up quite so bad and is not so hard to keep clean by running coal-oil through the carburetor. Our gasoline dealer suggested that it might be the gasoline, he said it was not as pure as it used to be on account of the large demand all over the country for gasoline, for that reason it is not as good as it was at one time and suggested that perhaps I need a new and more modern carburetor. Any enlightenment you can give me along this line will be appreciated.

Reply.—The trouble mentioned is not uncommon with old motors, particularly if they have seen considerable service and the worn parts have not been renewed. The car when new should average about 12 miles to the gallon and a loss of 50 per cent. in efficiency indicates wear. It may be that the cylinders are worn and that the compression is below normal, owing to a leakage past the rings. The valves may be in bad condition; that is, do not allow free ingress of the mixture and permit of a clean and rapid exhaust. The timing may be late, due to natural wear of the gears or the valve operating mechanism. Leakage of air on the intake stroke is a factor making for a waste of fuel as the mixture is enrichened to compensate for the extra air. Instances have been recorded where dragging brakes have contributed to low mileage to the gallon of fuel. Relative to the gasoline marketed, while the present grade is not as volatile as that of former years, it is stated that more efficiency is obtained from a gallon because more heat units are released. With old types of carburetors, especially those of the non-adjustable type, where the flow of the fuel through the spraying nozzle cannot be adjusted to meet requirements, more or less difficulty is generally experienced in obtaining a satisfactory as well as an economical mixture. It is not advisable to go to the expense of a new carburetor until a thorough examination is first made of the motor.

1739 **Timing the Simms Magneto.**

From T. M. Shaw, Connecticut.—Will you please send me instructions for timing the Simms magneto, as timed on the Maxwell car?

Reply.—Two types of magneto are employed with the Maxwell car, the model SU4 being utilized with the 1914 Maxwell and the SU4 D type with the 1915. As the model of the car was not stated, directions are given for the timing of both types, which is similar.

Assuming that the SU4 type has been removed from the motor, the first step is to crank the engine by hand until the piston of the No. 1 cylinder (that nearest the radiator) reaches top dead center of the compression stroke, or in other words, has fully completed the compression stroke which precedes the firing or impulse stroke. Next remove the dust or breaker box cover and rotate the armature shaft in the direction it operates, which can be easily determined by noting the direction taken by the driving shaft. If not sure of this point it should be ascertained before placing the piston at top dead center.

Rotate the armature until the figure 1 appears in the "sight hole" or indicating window on the distributor. This indicates that the distributor brush is in contact with the No. 1 post or segment, which terminal is connected by wire with the spark plug of the No. 1 cylinder or that on compression. With the distributor in position replace the magneto and couple it to the driving member. The high-tension wires of spark plug cables are replaced according to the firing order of the motor, which is 1-3-4-2, and according to the direction in which the distributor brush rotates which is opposite to that of the armature shaft. By connecting the posts of segments of the distributor in the following manner no trouble will be experienced: The No. 1 to No. 1 cylinder; No. 2 to No. 3 cylinder; No. 3 to No. 4 cylinder; No. 4 to No. 2 cylinder.

The model SU4 D Simms magneto is of the dual type and the current supply for starting is provided by a set of dry cells. The primary or battery current is intensified by a non-vibrating type of coil, but the same breaker mechanism and distributor are utilized. Proceed as with the SU4 magneto as the method is the same in so far as the motor is concerned. The distributor housing of the SU4 D differs from the other instrument in that it has no indictating window. Remove the distributor housing and rotate armature shaft until the distributor brush is opposite the No. 1 segment which is the lower left hand side, looking at the distributor end of the magneto. The firing order is the same as the SU4 instrument and the cables are replaced accordingly. If the car be the 1915 Maxwell employing the SU4 D magneto, care must be exercised in replacing the wires leading to the breaker box. The polarity of the dry cells must be observed; that is, the carbon or positive terminal of the group must be wired to the terminal of the dust cap and the negative or zinc terminal of the group connected to the fuse block. It would be best to obtain the wiring plan which is published in the instruction book issued by the Simms Magneto Company, East Orange, N. J. The book can be secured at any Maxwell service station.

Before completing the work it is well to examine the contact points of the breaker mechanism. If pitted or dirty, they should be cleaned, and it is advisable to measure the gap with the gauge. The gap with points fully separated should be approximately .015-inch.

If the driving gears or magneto coupling be badly worn it will be well to observe the position of the

Digitized by Google

contact points of the breaker mechanism when timing the instrument. With the breaker housing fully retarded, the points should begin to separate when the distributor brush is making contact with the No. 1 segment. Extreme wear can sometimes be compensated for by moving the gear driving the magneto shaft a tooth ahead, but this should not be done unless the wear and lost motion warrants the change.

1740 **Balanced Crankshafts and Aluminum Pistons.**

From Fred Noon, Pennsylvania.—Will you kindly tell me in the Trouble Department, what benefit, if any, would a balanced crankshaft be on a Ford, model T motor? Are aluminum alloy pistons worth the price they cost to install them in any four or six cylinder motor?

Reply.—Counter-balanced crankshafts are employed by some manufacturers, it being stated that they are effective because they counteract the effect of the contrifugal forces, largely reduce vibration and eliminate to a great extent local distortion of the shaft. In the conventional four-cylinder motor there are, from their inherent design and construction, unbalanced forces due to inertia, which increases with the square of the speed.

Relative to the use of aluminum alloy pistons in a four or a six-cylinder motor, the cost is warranted if the car is to be used for racing or a high speed motor be desired, although it is claimed by some that they are unsuited to a cylinder larger than 3½ inches. For ordinary purposes it is doubtful if the cost of installation would pay for the benefits obtained particularly if the cylinders are worn, and must be rebored and special pistons and rings made. If oversize pistons with rings can be secured for the motor, the name of which was not mentioned, and new pistons and rings are needed, the aluminum alloy piston would be preferable to the conventional designs. The advantages of the aluminium alloy pistons have been fully described in these columns and their substitution for the iron piston is a question best settled by the owner of the car.

1741 **A Tire Problem.**

From J. L. Donovan, Washington.—One day last summer while driving home a sharp report forward, followed by a series of bumps, indicated that a front tire had blown out. Diving into my "war bags" I located a piece of soft thick leather, commonly known as "pump leather," being used for pump valves and plungers. Having no other kind of blowout patch, I inserted the piece of leather, put in a new tube, and drove merrily home. Arriving home at noon, I left the car out in the hot sun while I went to lunch. Afterward when I went to put the car away, the tire was flat. Thinking there was a leaky valve, or something of that sort, I tried to pump it up, but it wouldn't pump worth a cent. In removing the tire I discovered that the heat had boiled the grease out of the leather and there was a rim of tallow all around the edge of the patch. You can imagine the effect on the tube. The outline of the patch was shown in a line of rotten rubber about half an inch wide, through which the air whistled loud and free. I now carry rubber and canvas blowout patches, and would not recommend leather, especially soft leather in contact with the inner tubes.

Reply.—Oil and grease are rubber solvents. Your leather patch has expensively proven this to you. If you have a car with a leather faced clutch member, you probably have learned, possibly also at considerable expense, that an animal oil or grease like tallow is good for leather, and that a mineral lubricant, like gas engine oil, is about as ruinous to leather as the tallow in the leather was to your tire.

1742 **Master Vibrator.**

From A. E. B., Pennsylvania.—1—I have a Ford car, early 1915 model, which after installing a New York master vibrator, doesn't run as smoothly as before. It is all right running in high gear up to 20 m.p.h., but over that or when running in low it misses badly at times. There is no short circuit at the timer and the plugs are clean and set at 1/32 of an inch apart. 2—Why does a mixture that runs the engine at highest speed on the level cause a sharp knock when taking a hill on high gear? 3—What is the gear ratio of a Ford transmission in low and reverse. That is if the engine makes something like 800 revolutions per minute at 20 m.p.h., how many miles per hour will you be going at the same engine speed in low gear, and in reverses.

Reply.—1—If your master vibrator is not properly installed, and to our personal knowledge many are wired improperly, this would not be unusual and would account for your seeming failure to get desired results. It may be that you have not screwed the coil vibrator blades down properly on all the coils, and you may not have adjusted the master vibrator blade properly. Our advice is that you follow the manufacturers installation and operation instruction implicitly, and that in case you do not get desired results they will be glad to advise you. The New York Coil Co., manufacturers of the New York Coil, is a reputable concern, and they have thousands of their master vibrators out and giving satisfactory results. 2—Probably because of pre-ignition. The more nearly perfect the mixture the more easily ignited and the more quickly consumed. A rich mixture burns slowly and reduces the power. A poor mixture also burns slowly, as evidenced by the possibility of "back fires," caused by the incoming new charge igniting from flame remaining in the cylinder after the exhaust valve has closed. 3—The bevel pinion is provided with eleven teeth and the large gear it drives has forty teeth, consequently the driving shaft and its pinion wil make 3 7/11ths revolutions for every one of the large gear when the high speed clutch or drive is engaged. At low speed the engine crankshaft makes about ten revolutions to one of the rear wheel. You can figure out what you wish to know from this information.

1743 **Broken Crankshafts.**

From Z. F. M.,(Massachusetts.—I have had bad luck in the last few days. I have two Whitcomb mine gasoline engines, and both crankshafts are broken. I can give no reason for this breaking. The motors were in good running order, all bearings rightly adjusted, and there was no noise, knocking, or carbon in the cylinders. All experts around here have failed to give me any reason for their breaking, and the only reason I can give is an overload. The motor has been run with care. I run one myself, but was not running either at the time of the breaking. Would a small flaw in the shaft cause it? On the first one that broke I could not see anything that looked like a flaw, but in the second shaft that broke. I would call it a flaw, the shape of a half moon and

Digitized by Google

about 1/3 of the shaft. I think an overload and a small flaw might have caused the break. Can you, or any of the readers of the Automobile Dealer and Repairer give me any reason for the breaking?

Reply.—The breaks occurred, according to your sketch, at the forward end of the rear crank pin and at the rear end of the center crank pin which accommodates the Nos. 2 and 3 connecting rods. These are structurally the weakest parts of any crankshaft, due to the torsional stresses to which it is subjected by the power stored in the flywheel, located at its further end. This crankshaft has no supporting center bearing, a construction which also necessitates a much heavier and stronger crankshaft than would one of three bearing design. Your surmise of the overload is hardly tenable, for gas engines cannot be overloaded, except they are overspeeded, without stopping them. Judging from your sketch it is our opinion that the cause of the breaks was unmechanical design resulting in a crankshaft of insufficient strength to stand the various stresses to which subjected. Too early ignition may have been a contributory cause. The crankshaft may have been weakened as a result of absence of "fillets" at the crank pin ends of sufficient size. The apparent flaw was undoubtedly due to an earlier break.

1744 **Wire Systems.**

From H. V. O'Brien, Illinois.—I have a Maxwell 25, 1915 model. I want to know if it is possible to change this single wire, resistance dimmer lighting system, over to series. That is, is there any way by which a single wire system can be made to shift from parallel to series, same as in a wire return system?

Reply.—Any single wire system can be operated in either series or parallel. If two lamps are wired in series only one, the last, should be grounded, and the voltage of the two lamps combined should be equal to the voltage of the single lamp wired as at present. If three lamps are to be wired in series the last one only should be grounded, and the voltage of each lamp should be but one-third, instead of one-half, as when two are used in series. The only difference between a grounded and wire return system is that the metal of the chassis takes the place of the wire which is used in the latter system to complete the circuit, which in both systems is metallic.

1745 **Soots and Misses.**

From E. G. Miller, Ohio.—The writer drives a 4-cylinder Maxwell Special 1912, Splitdorf low tension magneto, dash coil, start on dry batteries, Schebler Model L carburetor, fires 1-2-4-3. It misses and No. 3 cylinder soots up its plug; cannot adjust the carburetor to stop this. The other cylinders all fire clean. The compression is about the same on all cylinders and the same on battery or magnet. I take care of my own car but this floors me and our local garagemen have not been able to cure it. Tried carefully adjusting the spark gaps on all cylinders to .03 in. It runs well, pulls fine, and apparently fires regularly. When pulling the car it goes with an even steady motion and has lots of power; the skipping, however, must occur to some extent when running to soot up the plug. The irregular firing occurs more at starting and on low speeds. Will appreciate your experience and help. Have only had this trouble in the last three or four months.

Reply.—Sooting of the plug in the No. 3 cylinder may be the result of missed explosions, due to a fault in the magneto distributor, or to a leak or short circuit in the cable connecting with the plug in this cylinder, or in the plug itself. What is most probable, however, is a defective bearing between the cylinder surface and the piston rings. The cylinder may be badly scored, or the piston rings worn, broken or badly fitting. A weak or "set" exhaust valve spring is a frequent cause of missed explosions, a condition showing especially when the engine is being operated closely throttled or run at high speed, rather than when pulling on a hill on direct drive with the engine slowed and the throttle wide open. It would be but reasonable to suppose that carburetion or ignition could hardly affect the engine in the manner described, when symptoms so conclusively point to local, structural trouble. It may be that the inlet valve stem fits very loosely in its guide, although such a leak should affect, in a measure, the other cylinder of the pair.

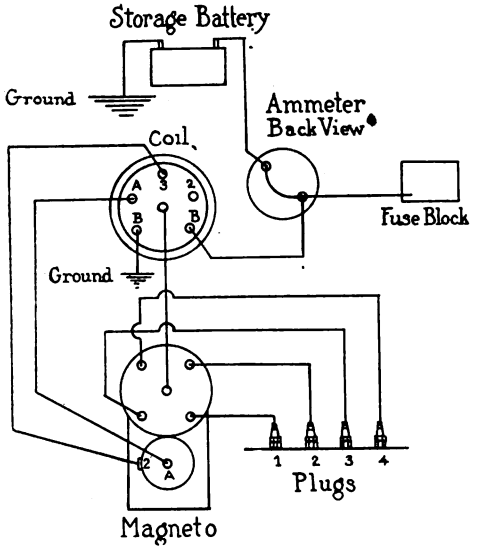
1746 **Engine Overheats.**

From Henry Kasserman, Ohio.—I drive a Metz "22," 1916 model. The car cools properly when driving on higher speeds, but when it is driven on the lower speeds it soon overheats. It very seldom smokes at the exhaust so I concluded that the lubricating system was out of order and had several repair men examine it; but it still overheats. There is an oil pump in the lower half of the crankcase, and nothing seems to be wrong. The car is equipped with an A. W. T. carburetor which has been adjusted properly. When the motor is hot, it is hard to "turn it over." Any information you will give about this matter will be greatly appreciated.

Reply.—The ignition of all Metz cars is by Bosch fixed spark magnetos. This prevents any manual variation of the ignition timing for varying speeds. When you drop back to lower speeds your engine speed increases and the lag of the spark and the other forces present combine to make the timing too late when the engine speed is high. If you were to change the fixed timing it might be too early for slow engine speed, causing pounds due to preignition. It possibly is set a little late. Late ignition causes the fuel consumption to increase, and the burning of excess fuel as a result of too late ignition creates more heat than the radiating system will take care of. It is most probable that the overheating is primarily caused by too much gasoline as a result of late setting of the ignition, or your mixture may be too rich at high engine speed. We are not familiar with the carburetor you mention. If the motor is hard to turn over when hot as a result of its heated condition, it is not unusual. If it is a result of ignition occurring too early we do not see any remedy except to have your magneto made over by the Bosch Magneto Co., into the adjustable type.

1747 **Cadillac Questions.**

From Chas. F. Isola, New Hampshire.—If it is not asking too much I would like to have the following questions answered in regard to my 8-cylinder Cadillac, 1915, type 51. 1—Could the generator, when running, feed the ignition and lighting circuit, aside from the storage battery? 2—Would the generator keep the lights and ignition circuit going, provided the storage battery were off the car? 3—Would it be asking too much to have you give a dia-



Digitized by Google

gram (with the direction of current) of the ignition, lighting and charging battery circuits of the 8-cylinder Cadillac mentioned above?

Reply.—1—According to the instructions for the care and operation of the Cadillac 1915, eight-cylinder cars, type 51, issued by the Cadillac Motor Car Co., for the operation of the Cadillac-Delco system—No. 2—Their instruction book contains in capitals the following: "Caution. Never run the car with the storage battery disconnected or while it is off the car. Very serious damage to the motor generator may result from such action." However, we do not suppose any harm could result provided the commutator brushes were removed. Your ignition would have to be from dry cells, and you could not operate lights. 3—The wiring of this car is very complicated, as may be judged from the use of the following different colored wires, in addition to the main lead for operating the generator as a motor and the secondary cables: red, black, yellow, green, yellow with red tracer, green with oak tracer and black with oak tracer. The wiring diagram is given on page 48 of the Cadillac type 51 Instruction Book, but it does not show the current flow, except from the storage battery. The system employed is the grounded or single wire, the motor generator, lamps, timer and storage battery being all grounded.

1748 **Storage Battery Capacity.**

From J. O. Gulledge, Arkansas.—In your August number you state that "One cannot start and furnish current for ignition from the same storage battery." This seems to be contrary to my experience. I have a model 79 Overland, which came equipped with a low tension Splitdorf magneto and coil and Gray and Davis starting and lighting system. By wiring my magneto and coil as shown in the enclosed diagram I use my storage battery (which is a six volt three cell Willard battery) for lighting, starting and ignition, and I get perfect results out of the system all the way through.

Wiring Diagram.

I also wish to call your attention to the 1914 Studebaker cars and the Reo 5th. They both use the same storage battery for starting, lighting and ignition. If I am in error I would like to have you explain same in your next issue, but I certainly use no dry cells since I wired my car as shown in this diagram. The only changes I made in the wiring was to take the No. 2 wire off the No. 2 post and put it on post No. 3, and ground one of the battery posts, running a wire from the storage battery line to the other battery post, thus leaving the No. 2 post vacant.

Reply.—The storage battery can be utilized as a source of current supply for ignition, motor starting and lighting. As you say, there are several cars marketed employing such a system.

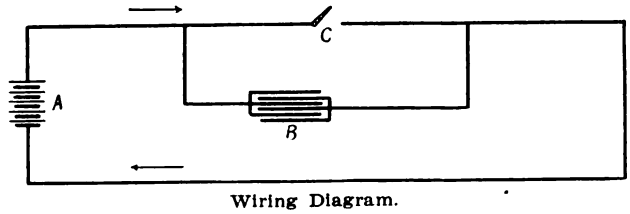
Relative to your changing the wiring of the ignition system employed on your model 79 Overland, as shown by the accompanying illustration, it can be done but it is not probable that you will obtain perfect results. Your eliminating the No. 2 wire on the transformer coil and carrying the No. 3 wire from the coil to the No. 2 post on the breaker box of the magneto, practically reverses the direction of flow of the induced or high-tension current and this grounded or secondary is discharged across the platinum points of the contact points; or in other words, it must jump the gap in order for it to get back to ground. Another factor to be considered is that the insulating material of the No. 2 post on the breaker box is subjected to the action of a high-tension current.

The Splitdorf magneto mentioned uses a parallel circuit when the instrument is supplying current for ignition. When you ground one lead of the battery and run the No. 3 post of the coil to the breaker box, a series circuit is obtained and this will cause a certain amount of lag which is due to the resistance of the armature and the primary of the coil. Therefore, at high motor speeds you will not obtain as good efficiency as with the parallel circuit.

As previously stated, you might operate the car for a considerable period without trouble, but as pointed out, the reversing of the direction or flow of the grounded induced current is not as satisfactory as when the electricity takes the path otherwise.

1749 **An Offensive Click.**

From F. G. Mayer, Ohio.—I have a Reo the 5th roadster, and the car has been run 2,400 miles. The engine is in good condition but is noisy; there being a loud metallic click or knock in the front half of the motor. I have very little carbon, have adjusted valves, and had others adjust them, have no loose play on the rocker arms, have adjusted the connecting rod bearings and main bearings, examined the piston rings and wrist pins and found everything in perfect condition. This click can be heard 30 feet away from the car and increases as the car warms up, and it then sounds like a valve plunger striking on the camshaft and gives off a ringing sound. It occurs at all speeds of the engine, whether standing or moving and at all stages of the spark. This click has developed during the last three months and seems to be getting worse. I have located it with the aid of a wire held in the teeth, to be in the No. 2 cylinder somewhere. I have taken excellent care of the car, and am annoyed very much by this noise and have been the subject of much ridicule on account of it. I would like to ask if such a noise could arise from a faulty camshaft? Can you suggest, from the above data, the cause, and a remedy? I will be very thankful if you can. I have also put in a new exhaust valve spring, without benefit.



Reply.—Before appealing to us for assistance you proceeded in an exceedingly intelligent manner to

Digitized by Google

locate the knock, which you found to be in the No. 2 cylinder. Knocks must be caused by either preignition or lost motion. From what you say we are satisfied that there probably is lost motion rather than any condition to cause preignition. In an anylytical manner we would reject any possibility of direct lost motion at the lower end of the connecting rod, but probably had you carefully examined the connecting rod cap you would have found that it had been worn slightly bell-mouthed, of larger diameter at the ends than in the center. Such a condition would conclusively prove that the hole through the piston is not exactly at right angle to the bore of the cylinder, being slightly higher in the piston at one end than at the other. When pressure comes against this piston the upper end of the connecting rod slides to the side of the piston in which the hole is higher, and on the exhaust stroke it slides to the opposite or lower side, as the centrifugal force carries the piston out from the crank pin. This condition is known as a piston slap. Your remedy is a new piston in place of the defective one. We do not know the method employed by the manufacturers of your car to machine the holes in their pistons, but we do know that trying to machine them properly by drilling operations in drilling fixtures, has cost some manufacturers a good many thousands of dollars. It was reported years ago that one automobile manufacturer in sheer desperation had been forced to machine the outside surface of pistons true with the wrist pin holes, having found it impracticable to drill or machine them accurately after the outside was finished.

1750 **Master Vibrators.**

From Harold D. Roberts, Oregon.—1—Will you please publish in the columns of your magazine a full explanation of the construction and operation of a master vibrator of the K-W type when used in connection with shunted vibrator coils? 2—Is there a condenser in the master vibrator and if so has it capacity to replace the condensers of the regular coils if one or more of them are punctured? 3—Would a punctured condenser in one of the regular coils act as a shunt across the primary circuit of

Wiring Diagram.

that coil and would the resistance of such a shunt connection be low enough to divert any appreciable amount of the current away from the primary windings?

Reply.—1—The construction and operation of the K-W master vibrator is practically the same as of all such devices, so far as principles are concerned. The description catalog of any one should give you the information you desire, but in order possibly to explain it more simply than manufacturers sometimes do, the diagram is reproduced in order to show the mission of a condenser. If the current from the battery A, is to follow the direction of the arrows, with the metallic cricuit closed at the switch C, there will be, as you probably know, a continuous current flow. If, however, the current is interrupted by opening the switch C, current will flow to the condenser B, and when the switch is again closed this current in the condenser will increase the flow just as the circuit is closed. If there were no condenser a spark would appear as the switch C is opened, but the condenser if properly functioning, prevents sparking at the switch. In the vibrating coil the vibrator is actuated by the current itself, the attraction of the armature of the vibrator blade to the core of the coil opening the circuit just as if it were operated by hand, as above described. If, however, the vibrator adjusting screw were adjusted to such a point that the vibrator blade could not move it would be impossible to break the circuit and a dozen condensers in the shunt, perfect or perforated, would have absolutely no effect. So you will observe that screwing down the adjusting screw until the blade cannot vibrate, puts the condenser out of business. It does not matter what its condition is. With all the blades screwed down until they cannot move a master vibrator put into the main primary circuit would have to have a condenser in its construction, the vibrating blade and condenser doing the work for all four coils which the separate vibrators and condensers previously performed. But supposing this master vibrator were not put into the main primary circuit, but were put, as is frequently done, in one of the four separate coil circuits, only one coil would act, and it would take four separate master vibrators to make the four coils operate. 2—Already answered. 3—You should be able to answer this in the negative if you thoroughly understand the diagram and our reply to your first query.

STORAGE BATTERIES.

Information as to Their Care, and Instructions as to Their Recharging.

BY C. P. SHATTUCK, M. E.

Efficiency with electric lighting and motor starting systems or ignition systems relying upon the storage battery as a source of current supply, depend upon the battery, and when it is considered that the current derived is due to chemical action and reaction, it is obvious that the cells must be given careful attention if satisfactory results are to be obtained. This applies particularly in the winter months when the car with electric lighting and starting is not operated as regularly as in warm weather; that is, it is not driven on long runs. Temperature has much to do with the efficiency and output of a battery. It is held that the best results are obtained at a temperature of about 70 degrees Fahrenheit. At 20 degrees below zero the output is about one-third, hence it is apparent that the cells must be maintained in a more fully charged condition in cold weather. This contention is sustained by the directions found in books dealing with the storage battery and its care.

It is not the purpose of the writer to discuss the construction of the storage battery other than to explain that the lead type consists, briefly, of positive and negative plates, separators and the jars. The positive plates comprise supporting and current conducting grids, and active material in the form of red-brown lead peroxide, while the negative plates are similar grids and a peculiar amorphous form of metallic lead known as sponge lead. During the discharge a reaction takes place, the plates absorbing sulphuric acid from the electrolyte and part of the

Digitized by Google

lead sponge changes to lead sulphate. It is important that both of these elements be maintained in good condition with the same charging treatment, because, apparently, treatments which are beneficial to the positive are harmful to the negative, and vice versa. Conditions may be so adjusted, however, as to maintain both positive and negative in perfect shape. To keep the cells in the condition referred to it should never be fully discharged. Some authorities hold that a gravity reading of 1.100 of the electrolyte is the minimum point, but the writer contends that 1.150 will indicate that the cells are completely discharged and when in such a condition, must be recharged with care.

The work of recharging a wholly or partially discharged battery may be accomplished in several ways. The writer believes that the best method is to carry the battery to the nearest service station, especially if the battery has been in service for a considerable period and the owner has not given it the attention it requires. On the other hand, the owner can charge the cells, utilizing the generator on the car, the house or garage current or by means of a dynamo.

Before discussing the various methods a description of the hydrometer will be of value for this instrument is considered by battery experts to be the only reliable way of determining the condition of the cells, and it should be employed during the work as well as from time to time when the battery is in service.

The electrolyte or liquid in the cells of a battery is composed of a certain proportion of pure sulphuric acid and distilled water. As previously pointed out, during the discharge the plates absorb the acid, consequently the electrolyte becomes lighter or less dense as the acid is considerably heavier than water. The hydrometer is a glass tube having a rubber bulb at one end and a small tube at the other. The glass member contains the hydrometer proper which floats when the large tube is filled with the electrolyte which is withdrawn from a cell by compressing and releasing the rubber bulb. The stem of the hydrometer is graduated, the larger numbers being at the bottom and the smaller at the top. The more acid or dense the electrolyte, the higher the hydrometer will float, and the reading on the graduated stem at the point where it emerges from the solution is the specific gravity of the electrolyte. An enlarged section is shown at Fig. 1, A, showing the float resting at 1.280, and indicating that the cell is fully charged. The gravity reading is expressed in points. Thus, the difference between 1.275 and 1.300 is 25 points. When all cells are in good condition the gravity will test about the same (within 25 points) in all. Gravity above 1.200 indicates that the battery is more than half charged. Below 1.200, but above 1.150, indicates less than half charged. Gravity below 1.150 indicates that the cells are completely discharged or run down. When the gravity is about 1.150 it is very difficult to charge with ordinary driving of the car and will require separate treatment. In connection with the work of taking readings, it should be borne in mind that it should be done before adding water, for a reliable reading cannot be obtained until the water mixes with the solution which is brought about by the charging process. In charging the battery observe the following precautions:

Remove the vent plugs.

Keep solution at proper height, never allow it to get below top of plates.

Observe polarity with direct current.

Do not add acid or electrolyte to the solution.

Do not permit a naked flame near battery, its gases will ignite.

Use nothing but pure distilled water.

Keep battery clean and dry. If solution be spilled, wipe up with waste saturated with ammonia.

Keep terminals clean and bright to minimize resistance.

In taking readings, always return electrolyte to the same cell. Storage batteries may be charged from 110-volt direct current, that of the house or garage, by utilizing a bank of electric bulb or lamps for resistance, the number and candlepower depending upon the charging and finishing rate recommended by the maker of the battery. It is because of the varying conditions inherent with batteries necessitating different rates in charging that the manufacturer advises the motorist to take the battery to a service station or an exeprt. There are

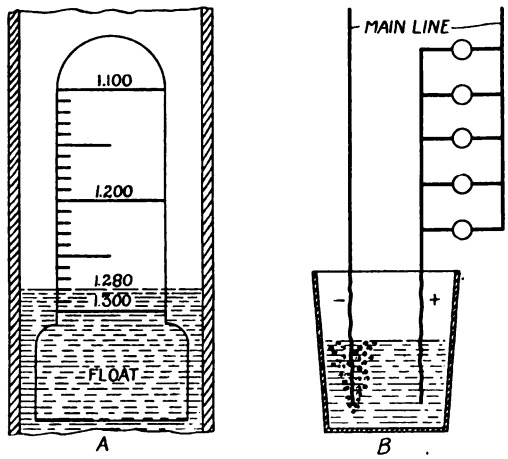


Fig. 1—Charging Storage Batteries: A, enlarged section of hydrometer with float resting at 1.280, showing that the cells are fully charged; B, ascertaining polarity of leads from source of current supply.

times when a battery requires a long, slow charge to bring it up to efficiency, as when the plates are sulphated, and then again a cell may require special treatment.

If the battery be in good condition; that is, the plates and other components, and the motorist is careful to observe the starting and finishing rates as recommended by the maker, he should be able to obtain good results. The charging rates are given on the name plate of the battery, and these rates determine the number of lamps to be used. Utilizing carbon filament lamps for resistance, the desired starting and finishing rates may be determined by figuring that a 32 candlepower lamp will give a flow of one ampere, a 16 candlepower bulb ½ an ampere and so on. For example, if an 80 ampere-hour battery has a finishing rate of five amperes, the cells will require five 32 candlepower lamps or 10 16 candlepower bulbs. To fully charge an empty battery by this method, it should be connected to the circuit for one period of 24 hours or two periods of 12, or until each cell gasses freely and shows a specific gravity reading between 1.275 and 1.300.

Fig. 2 shows the arrangement of the lamps and method utilized in charging with 110 volt direct current. Eight 16 candlepower (50 watt) carbon filament lamps are used, and the wire A is connected from one side of the source of current supply to one

Digitized by Google

side of the bank of lamps. Another wire, B, is employed for connecting the other side of the lamps. A third wire, C, is utilized to the other pole of the lighting circuit. When the wire C is connected with the end of the wire B, the lamps should burn. A two-pole switch and two 15 ampere fuses are connected as indicated in the drawing, the functions of the fuses being to prevent the passage of too great an amperage which would injure the battery. Before attaching the wires to the battery it is highly important that the polarity of the current supply be ascertained, or in other words, the positive lead must be connected to the positive terminal of the battery and the negative to the negative. Fill a tumbler about half full of water and add a few teaspoonfuls of salt, dissolving the last named. Immerse the ends of the wires B and C in the fluid, taking care to keep them at least an inch apart. With the switch closed and current flowing, bubbles will be given off the negative wire. Another method, a similar one, is to place a small quantity of the electrolyte in a clean tumbler with a strip of lead attached to each wire, and turn on the current. In a few minutes the metal connected to the positive wire will turn brown. The diagram given herein is that recommended by Gray & Davis, Inc., for charging the battery used with its lighting and starting system when a house or a garage direct current is employed. The resistance required to obtain a flow of four amperes may be obtained by any of the following banks of lamps:

8 110 volt 16 candlepower carbon lamps.
4 110 volt 32 candlepower carbon lamps.
16 110 volt 25 watt mazda or tungsten lamps.
7 110 volt 60 watt mazda or tungsten lamps.

The charging operation should continue from 24 to 30 hours, or two periods of 15 hours each. If the voltage or pressure be 220 volts, use 16 lamps of 16 candlepower, or eight lamps of 32 candlepower and charge from 24 to 30 hours. Batteries may be charged in a shorter period, directions for which are generally marked on the battery plate, or the information can be obtained from the maker.

Fig. 3, A, is a diagram for charging a type P. S.

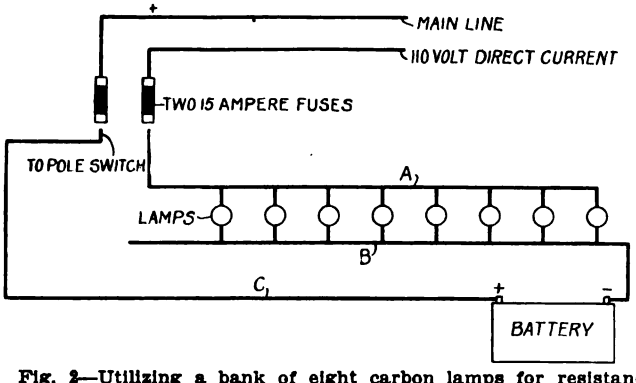

Fig. 2—Utilizing a bank of eight carbon lamps for resistance and wiring diagram including switch and fuses.

W. 68 LBA battery of 100 ampere hour capacity. For charging use five 110 volt 32 candlepower carbon filament lamps or 10 16 candlepower of the same voltage, or 13 110 volt 40 watt tungsten or 20 110 volt 25 watt tungsten bulbs. The starting rate is 12 amperes and is continued until the electrolyte in the cells gasses or bubbles freely. Then continue the charge for six hours at the finishing rate of four amperes. The reading at the completion of the charge should be between 1.275 and 1.300. If not, continue the charging at the finish rate until the specific gravity stops rising, which is generally an indication that the cells are fully charged.

The illustration at Fig. 3, B, depicts the use of a rectifier for charging a battery when the source of current supply is alternating. These rectifiers are moderate in price and a large variety is marketed. They consist of a small apparatus as shown and are connected to the source of current supply by means

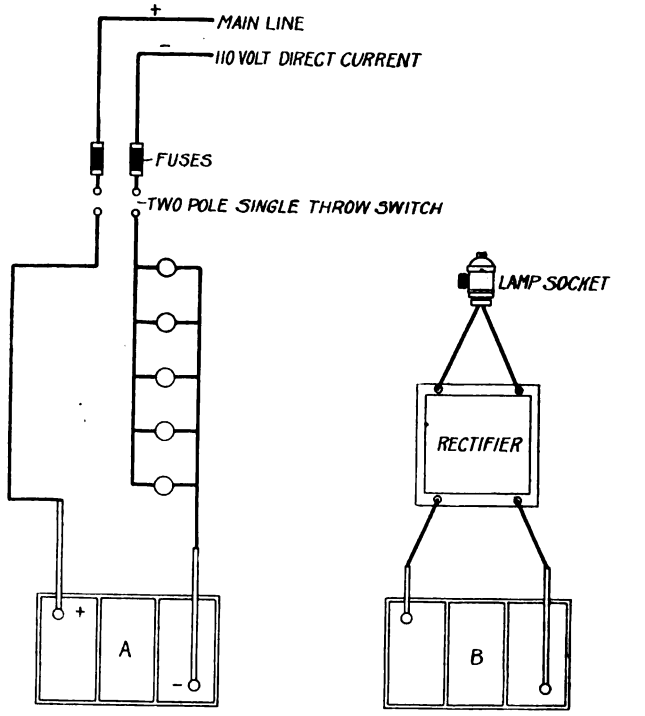

Fig. 3—Charging with a bank of five lamps at A, and use of rectifier when an alternating current is employed.

of a plug. The object of the device is to establish the polarity, which is done automatically, provided the battery is connected to the rectifier before the alternating current is turned on. In purchasing or ordering a rectifier, state the voltage and cycles, which information will be supplied by the company furnishing the house or garage current.

Relative to charging batteries from a dynamo or generator other than those on the automobile, it will be necessary to employ a sufficient resistance in the circuit to obtain the proper charging rates. If the machine be an alternating current generator a mercury arc rectifier will be necessary to convert the current into direct, but a resistance will be required; that is, if the amperage is greater than that of the charging rate. The equipment for charging should include a voltmeter and ammeter in order to measure the quantity and the pressure of the current being generated, and a switch and a fuse block to save the machine should the demands on it be too heavy.

The writer has not attempted to outline the methods for charging a battery by using the generator on the car, as this information is best obtained from the manufacturer of the lighting equipment. No directions are given for the care of the battery that is not to be in service for a considerable period as the writer believes that it should be taken to the service station and stored. For the benefit of those not familiar with the storage battery of the lead type it is explained that if it be allowed to stand for any great length of time while in a discharged con-

Digitized by Google

dition, the plates become covered with a thin coat of sulphate of lead, a condition known to battery men as sulphated. The remedy is to take it to the expert who will give it a long slow charge of say two or three amperes, for three or four days or longer, according to conditions. From the above it will be seen that the storage battery requires careful attention, and as they are expensive and the successful operation of the lighting, starting and some ignition equipment is dependant upon them, it behooves the motorist to treat them at least intelligently.

REPAIR CHARGES.

Estimated Prices for the Labor and Not the Material.

From Newsabout Fords.—A good list for repair men:

Overhaul—	
Motor and transmission	$18.00
Motor only (or motor and transmission out of car)	14.50
Transmission	11.00
Repair—	
Burned out bearing	10.50
Main bearing knock	8.50
Put in two or more pistons	6.00
Cylinder knock	5.00
Put in two or more connecting rods or repair oil leak	5.00
Put in one new piston	5.00
Leak in crank case	5.00
Put in one connecting rod	3.75
Grind valves, clean carbon	2.75
Change transmission bands	2.50
Rebore and rebabbitt cylinder block including fittings of pistons	3.00
Rebore cylinder block only	2.00
Tighten transmission gasket cover on case, or rebush transmission	2.50
Cylinder head bolts (stripped)	2.50
Replace crank shaft starting pin	1.50
Cylinder front cover	2.00
Overhaul carburetor	2.00
Braze crank case arm only	1.50
Change cylinder head gasket	1.25
Tighten motor to frame	1.25
Commutator wire loom and brush	1.00
Assembly fly wheel only	1.00
Change carburetor	.75
Leaky door or clean crankcase	.60
Change fan pulley assembly	.60
Commutator pull rod ball joint	.50
Leaky carburetor	1.00
Overhaul rear axle or install new housing	6.00
Change rear radius rod	1.50
Replace—	
Rear spring, tie bolt or new leaf, including graphiting leaves and line up body rear spring tie bolt only	3.00
Rear spring tie bolt only	1.50
Rear axle assembly	3.00
Repair—	
Rebush system	3.00
Install universal joint	2.50
Shaft straighten	1.50
Dope leak, one side	1.00
Install brake shoes, each	1.00
Equalize emergency brakes and fit brake shoes, or repair hand brake lever quadrant	1.25
Emergency brake only	.75
Tighten universal joint	.60
Or change truss rods, each	.60
Or change brake rod supports, each	.60
Install or tighten rear spring retainer clip	.60
Rebush front axle	5.00
Repair—	
Rebush spindles (each side, $1.50)	3.00
Broken off radius rod ball cap stud	2.50
Straighten front axle	2.50
Front spring tie bolt—or new leaf, including polishing and graphiting leaves	2.00
Front spring or tie bolt—replace only	1.00
Tighten ball cap or replace radius rod	.60

Novel Way to Climb Hills.

From W. L. R., New Jersey.—I met Tom and his wife and boy on the boat, Digby, N. S., to St. John, N. B., Canada, late in August. He had his 1914 Buick touring aboard and intended taking the "Air Line" from Calais, Me., to Bangor.

The Blue Book warns about this route that at one distance there is no gasoline for ninety miles, and that houses are ten to twenty miles apart with no hotels and of course no garages.

The road is rough and extremely hilly. The Maine Automobile Association had also advised against this route. I told Tom this, but he took it. Later I met him in Massachusetts and he said the "Air Line" was all I said and more. One hill he said he could not get up, try as he would, because his tank was gravity fed and while full, that the hill was so steep the gas would not flow.

"But you did get up?" I said .

"Yes," he replied, "or I would not be here; but how did I do it?"

I knew it was improbable that any car had towed him and guessed he reversed up.

"No," said Tom, "my reverse is not as strong as my first speed. I tried that and while the gas flowed I had not sufficient power. Neither was I towed up."

I had no more guesses and Tom told me. In his car was a small drinking cup. He found an empty quart tomato can. He fastened the drinking cup in a wire sling and dipped it into his gas tank, filling the quart can and placing it on the floor of the car. Then he raised the hood and put his ten-year-old boy on the running board, telling him to dip the drinking cup into the quart can and pour gas from the cup into the carburetor.

At first the engine spluttered and missed but the boy soon learned how fast to pour. Tom ran up the hill a quart at a time, stopped, drew off another quart and went on again until he reached the summit, three quarts I think it was, and naturally much gas was wasted. He does not advise this for common use but the hint may help some fellow motorist up another hill if the small boy is handy.

New water connections are rarely tight for any length of time, when first fitted. Watch them for the first few hundred miles. This applies especially to a new car. If there is leakage, tighten just sufficiently—and only sufficiently—to stop it. If you tighten excessively at first, you simply maul the rubber, and do not ultimately prevent leakage. Therefore, tighten little by little, as required.

It is just as important to retard the spark when using a starter as when hand cranking.

ANOTHER WARNING.

We must once more caution our readers against paying money to traveling subscription solicitors unless absolutely assured that they are all right. There appears to be a swarm of these rascals going around the country soliciting subscriptions for our publication and others and putting the money in their pockets without reporting anything. Many of them travel in automobiles. They offer premiums and all sorts of inducements, not authorized by the publishers, for the sake of getting money. Of course, obtaining money in this way, under false pretenses, is a penal offense and is going to land some of these rascals in State's prison before a great while. We are on the track of several of them now. The best way, always, is to send your subscription through the mail to the publisher of the particular publication you want. A remittance by check or money order is always safe.

AFTER THE WAR, WHAT?

There has been and will continue to be considerable speculation as to what is going to happen after the European war, and especially as to its ultimate effect upon this country. The matter has been made the subject of lectures and comments by economists and business men, and although the conclusions drawn are not absolutely identical, the consensus of opinion seems to be that it will make hard times in this country, that we are likely to have an invasion of foreign workers and of foreign goods, and that money will be extremely scarce.

We cannot agree with any of these conclusions. Of course the extra business now being done in this country owing to the war will be wiped out, but the hundreds and perhaps thousands of millions of dollars already brought into the country for farm and other products incident to the war will still remain here, and this will be quite an addition to our national wealth and prosperity. Whether this additional wealth will compensate for the lost war business is a matter of uncertainty, but that for a number of years it may make up for it seems reasonable.

When the war is over it will have accomplished the greatest destruction of men and of property the world has ever witnessed in a given period. But it will not have destroyed money, the representative of property, to any great extent. Some money will have been burned up and some lost, but this will be a mere bagetelle compared to the whole. Yet it will have been redistributed as it has never been before. Nations that have not been at war will have some of the money of nations that have been at war, but the great mass of the people in the warring countries will probably be as well off in a material sense as they were when the war began. They had little then, but they will at least have an opportunity to work when the war is over, and this is equivalent to money. In other words, disguise it as we may, the rich will be far less rich, and the very poor far less poor.

On the other hand, not only will there be a great demand for labor to restore that property which was destroyed in the war countries, but that demand will be still further augmented owing to the lessened supply resulting from death and disablement. It is thus evident that there will be no invasion of workers to the United States; the stream of labor does not flow from countries where there is a good demand for it to a country where there is little or no demand for it, but rather the other way. Indeed, unless a good share of South American trade be permanently secured by the United States at the close of the war, this country will have all it can do to supply work for its own workers, and in our opinion the drift of labor will flow into the European war countries rather than away from them.

Contrary to the usual conclusion, whether a country be poor or rich, labor will always be prosperous when the demand for it is greater than the supply, and it will never be prosperous, no matter how rich the country, when the supply of it is greater than the demand. Look at England, for instance, the richest country on the face of the globe before the war, and yet labor there was about as poorly paid as in any country in the world. Great as England undoubtedly is in the things that make for high civilization, this war is teaching her the lesson that if the interests of the workers are not considered in times of peace, the workers will not be likely to consider the interests of their country in time of war. And this is a lesson our own country may well heed.

Nor do we look for an influx of cheap foreign goods when the war is over, and largely for the reasons stated, namely: Such countries will for a time have enough to do to rehabilitate themselves and the scarcity of labor there will add to the cost of production, thus making competition with this country more difficult than before the war. But later on, when things there attain their normal state, we shall need something more than the "tariff for revenue" law of 1913 to protect the American wage-worker.

CAUSE OF PRICE CUTTING.

The address of J. C. Thorpe at a convention of the Ohio garage men, which will be found on another page, is well worth reading, whether one owns a garage or not. It is worth a passing thought that although 25 years ago the "evil of price cutting" was scarcely ever mentioned or considered, to-day it is almost a universal theme among all business men. Whence this change of opinion?

It is due to the fact that 50 years ago—and possibly it holds good even as late as 25 years ago—price cutting was not an evil because it scarcely existed, having been unnecessary, while to-day it is undoubtedly a great evil. Why now and not then?

Simply because of the marvellous increase in industrial productive capacity. When no more of a thing can be produced than the people want or need to consume, there is never any price cutting. All will be sold that can be produced without cutting prices. But just as soon as production outstrips consumption, price-cutting is as sure to follow as night follows day.

If there are two automobile or accessory dealers in a town, and each has a bigger stock than he can dispose of at maintained prices, while two or three times a week a manufacturer's salesman calls upon him and urges him to buy more, quite likely at a large reduction from former prices—simply because the manufacturer himself finds he can produce more than he can sell—the temptation of the accessory dealer to cut rates can hardly be overcome. The only thing that will prevent it is a dealers' association forbidding price reductions.

Such is the situation, and in considering it business men would do well to distinguish cause from effect. Instead of trying to stimulate over-consumption by the ruinous plan of price-cutting, they should head off the trouble at its source, and take steps to reduce production to the point of the consumptive demand.

How are you going to do it? some one asks. In reply we state this is not the occasion to go into that. Having pointed out the cause of the price-cutting evil—an evil which business men are now admitting and crying out against—the remedy is less difficult than may be imagined.

But whether the cure be easy or hard, it would be amusing if it were not discouraging to note the efforts made to cure it by the means of "greater efficiency." Having been confronted by an evil that is solely due to too much efficiency, the idea of curing it by still greater efficiency reflects little credit upon the business thinkers and economists of the present day.

CAR STARTERS.

It is not by any means a positive fact that electric starting and lighting will be a permanent and universal accessory of the automobile. True, it might be, if owners and drivers of cars were considerate and careful, but as a rule they are not. Not long ago no engineer would have dreamed that a battery could be made weighing, say, about 30 pounds, and about a cubic foot in size, that would give the discharge of a horse power and not be completely ruined.

Yet a good many drivers take their cars out on a cold morning, when carburetion is difficult and simply keep the starter pedal down until the beat of the engine is heard. Of course this is liable to ruin the battery and is pretty sure to injure it, if the mandates of the battery manufacturers are worth anything. Few car owners, indeed, take the trouble to carefully read and digest the printed instructions which usually do and always should accompany the electric self starting and lighting systems. Or, reading them, they do so not until they have spoiled the battery by its misuse.

In our opinion some sort of a spring or pneumatic starting system is the only one fit for the heedless driver or car owner. Even then, he will expect the starter to work when he himeslf could not start the car with the crank to save his life.

UNJUST DISCRIMINATION.

Just why a special tax on automobiles and gasoline should be considered to secure additional revenue is beyond ordinary comprehension. It is proposed to place a tax of about 10 per cent. ad valorem on all automobiles manufactured, the ad valorem to be based on the manufacturers' costs. This would yield $38,000,000 a year. The argument advanced in favor of this tax is that the automobile manufacturing business is "very profitable" and that as business must bear part of the burden the automobile business should bear it on the ground that it is best able to stand it. The tax proposed on gasoline is two cents a gallon.

But why tax automobiles any more than horse-drawn vehicles? Why tax gasoline any more than, say, cottolene? It is true that in some instances automobile manufacturers have made big profits, but the automobile grave-yard is abnormally big for a new industry, and many of the headstones represent untimely deaths. Quite likely the returns from the entire investment in this gigantic business has not been two per cent. a year. It has been a case where "many are called but few are chosen."

Of course these proposed taxes will fall entirely upon the car owners, most of whom are of moderate means, and quite a large proportion could under no circumstances afford to indulge in the luxury of horses and horse-drawn vehicles.

Thus the idea of having the tax fall upon wealth alone will not be accomplished, nor could it be with all the wisdom of a regiment of Solomons. And here again we must remind our law-makers that it is not their business to either consider the rich or the poor except as it promotes the public welfare, which is the goal of all legislation.

GARAGE VENTILATION.

As we understand it—and surely there is no possibility of too clear information upon the subject—there are two kinds of dangerous gases incident to running the automobile, carbon dioxide and carbon monoxide. Carbon dioxide is a non-supporter of life, and although not in the strict sense a "poisonous" gas, to remain in an atmosphere of it for any length of time would be likely to prove fatal. Thus it is that to stay in the vicinity of the exhaust even for a little while, and where it cannot be dissipated quickly by the air, as it is a very heavy gas, causes headache or faintness.

Carbon dioxide and steam are the normal products of the fuel combustion. Carbon monoxide it appears is the product of incomplete combustion, and is far more fatal in its effects.

The lesson is easy and simple. It is that an engine should not be run more than a few minutes in a

Digitized by Google

closed garage. If it is necessary to run it longer than that, some means should be provided for "airing out" the garage, and this is not as easy as if the gas to be got rid of were not heavier than air. And, by the way, it is as important that a garage be as well ventilated as a dwelling.

PROTECTION BY FREE TRADE.

It appears that the new British finance bill provides a duty of 33 per cent. on pleasure automobiles, motorcycles and accessories. It does not apply to commercial cars simply because that country needs for war purposes all the cars it can get of that kind.

The fact calls for no comment save that it indicates that despite the misuse of the term, protection may mean either tariff duties or free trade. The main purpose of all nations is to protect themselves, and if tariff duties serve that purpose, then they are levied, while if free trade or the absence of such duties best conserves the public welfare, then that form of protection is adopted.

England has been a free trade country simply because that principle has best promoted the public welfare there, and the most ardent believer in tariff duties for this country will not attempt to dispute the soundness of the policy—for that country.

But when her interests are best promoted by tariff duties, England promptly levies them. The free trade policy is just as selfish as the protective policy; the object of each is to protect the home interests, and the policy that might protect one country would ruin another.

AMERICA FIRST.

It is about time to call a halt to the slanderous reports that the American people are little else than "dollar chasers" and "dollar worshippers." Although the dollar is doubtless rated at too high a value among all nationalities, there is no place on earth that it is thought less of in comparison to other things than right here among the American people, and when we speak of the American people we do not mean hyphenated Americans of any sort.

The remarkable thriftiness of our freign-born residents was recently shown in a way of a report of the postal savings banks of Chicago, forty-seven in all, which showed that nearly three-fourths of the total deposits of $3,267,532 were made by them. It is a fact, moreover, that our foreign-born residents will thrive and grow rich on incomes upon which native Americans will half starve.

We are for the American people, their customs, their goods, their ways of living, their ideals and their business and intellectual honor, first, last and all the time.

We are for American schools and churches, and for American tolerance and benevolence. They are superior to those of any nation or civilization on this broad earth.

If there are any in the country who hold different ideas, the gates swing open as wide outwardly for them to depart for some other country as they opened inwardly to them when they came here.

A MANUFACTURER'S MISTAKE.

Car manufacturers make a mistake by referring inquiring owners of their cars to their own salesmen, when such inquiries are in relation to either the care, operation or mechanism of their own product.

We have in mind one case where the owner of a car wrote to the manufacturer for information in relation to its lubrication but he was politely referred to the agent who sold it to him.

Now there may have been several good reasons why the owner of the car did not wish to consult such an authority or lack of authority. It may not have been convenient, the owner may not have had confidence in the knowledge of the salesman, or he may have purchased the car second hand. In any case, the information should have been given promptly from the factory.

A FAVOR ASKED.

We are anxious to increase our subscription list materially during the year 1916. Will our readers help us do this? Any reader who recommends the Automobile Dealer and Repairer to friends owning cars will be conferring upon them perhaps more of a benefit than upon us. The dollar we get for a subscription does not afford much, if any, profit, but the car owner who reads our paper regularly for a year is sure to be greatly benefited, in many ways. We want to ask our readers therefore to each send us one new subscriber, or more if he wants to. Each present subscriber of the Automobile Dealer and Repairer who will send us one new subscriber with a dollar will have his own subscription extended for three months, and the new subscriber will get the benefit of our special offer to new subscribers only, of fifteen months for a dollar. Now let us all pull together for a little while, and see what can be done.

LESSONS FOR DRIVERS.

Carelessness and Ignorance Responsible for Most Accidents.

Blanket Becomes Entangled in Pedals.—A man was instantly killed at Allentown, Pa., when a high wind blew the blanket in the way of the pedals so they became entangled and caused the driver to lose control of his car. One of the occupants was thrown out and sustained a fractured skull from which he died.

Road Hidden by Hedge Fence.—Three persons were painfully injured, one perhaps fatally, at Oswego, Kan., when two cars collided at cross roads. The cars were hidden from each other by a high hedge fence and on account of the strong wind the warning signals were not heard.

Charged by a Bull.—A driver, near Prophetstown, Ill., met on the road an unruly bull. The driver slowed down, which seemed to be what the bull wanted, and when the car came within the right distance the bull hit the fender and nearly overturned the auto. The fender of the car was badly demoralized, but the man was glad to escape with his life.

Lights Obscured by Dense Smoke.—It was impossible to see the lights from two machines caused by dense smoke from burning leaves, near Rock Falls, Ill., until they crashed into each other. Two men were thrown from one of the cars and badly injured, and a woman and a man were thrown from the other. The woman received a badly cut face. The tragic part of the accident was that a woman who witnessed it fainted and was seized with heart failure and died almost instantly.

Raced with a Train.—One woman was killed and another woman and a man were painfully injured when their car was struck by a passenger train near

Digitized by Google

Chenoa, Ill. The train came up behind them and it is stated they raced with it for some distance and outdistanced it. They were so far ahead that they assumed it was safe to cross, and as the automobile mounted the center of the tracks the engine died. The train struck the car and scattered the occupants in all directions.

Blinding Lights Cause Accident.—At Lincoln, Neb., a woman was killed when her husband who was driving the car became blinded by the bright lights on an approaching automobile. The car dashed off a bridge into the water and overturned, pinning the occupants beneath. It is stated that had the occupants of the car that caused the accident stopped and rendered assistance the woman's life could have been saved, but she was drowned beneath the car. Her husband succeeded in dragging himself out.

Caused by a Coughing Spell.—A driver lost control of his car at Delaware, Ohio, when he was seized with a spell of coughing and leaned over the fender to expectorate. The car glided into a ditch and finally turned turtle. One man sustained a gash across the jaw but the other escaped injury.

While Receiving Instructions.—At West Liberty, Ia., a woman was killed while learning to drive a car which her husband had recently purchased. A tire blew out and the machine skidded off the road and overturned in the ditch. The woman was caught under the steering wheel and crushed beneath the heavy car. Both her skull and chest were terribly crushed.

While Cleaning the Engine.—While cleaning the engine of an automobile of which he had charge, a young man at Cleveland, Ohio, was caught in a trap of flame and burned to death. He was lying under the machine when the explosion occurred but just what caused the explosion could not be determined. Blazing from head to foot he rolled from under the auto down a driveway and people rushed to his aid, but he was so badly burned that recovery was impossible.

Blinding Light Causes Trouble.—A heavy car with blinding lights going at a high rate of speed and occupying the entire road at Monticello, Ia., caused a driver at that particular place to pull clear out of the road to avoid a collision. In doing so he struck the bridge railing. A young man who was with him was cut about the head by glass from the broken windshield.

Flagman's Signal Causes Accident.—When a flagman stationed at a railroad crossing at Madison, Wis., signalled to an automobile party to come ahead, the driver found himself in a network of tracks and several freight cars bearing down upon him. The flagman frantically waved them back, and the driver by speeding up his machine succeeded in saving the life of his wife and himself, but the machine was struck by a box car and badly damaged.

At a Dangerous Crossing.—Near Leroy, Ill., two men were killed and a young lady and man injured when a collision occurred at a crossing, the view of the roads from either direction being almost impossible.

Driver Turned to Look.—An automobile struck a telephone pole, near Geneva, Ill., when the driver turned to look back. One woman occupant of the car was hurled through the windshield and received a broken jaw and possibly a fractured skull. It is stated that two women in the rear seat asked: "Why don't you say something?" and the driver turned to answer.

Excessive Speed.—In an attempt to make a short turn in Sioux City, So. Dak., an automobile collided with a trolley wire pole. The driver was caught behind the steering wheel of the machine with such crushing force that he was badly injured internally and died shortly after the accident. The other occupant of the car was seriously hurt and is in the hospital.

Surrendered Wheel to Inexperienced Driver.—One young man was killed and four other occupants were injured when a car driven by a young lady turned turtle near Streator, Ill. The party was on a pleasure trip and the young man who was killed, and who was a capable driver, had driven the machine until just before the accident, when his young lady companion took the wheel. It is said she attempted to turn from a lower to a higher road and the machine became overbalanced and toppled over.

Brakes Bothered.—Near Elgin, Ill., it is presumed that the driver in attempting to stop the car became bothered with the brakes with the result that the car stopped dead on the railway track. It was struck squarely, the occupants hurled thirty feet and the machine was totally wrecked. Two women and two men were killed.

At a Sharp Turn.—One man was instantly killed another fatally crushed and five others injured near Conneaut, Ohio, when the automobile in which they were riding was wrecked. They were going at a high rate of speed and the driver did not observe a sharp turn. The car struck the curb and turned completely over.

Bulldog Causes Accident.—A dog ran out and grabbed the wheel of an automobile that was passing at Davenport, Ia., and caused the driver to lose control of the steering wheel. The machine ran up on to the curb into a baby carriage, crashed into a house and smashed up against a tree. The child and nurse were bruised somewhat and the dog was run over and killed by the machine.

While Walking on the Sidewalk.—Three women were injured, two of them seriously, at Milwaukee, Wis., when they were knocked down by an automobile and dragged about thirty feet. The car that caused the accident was coming at a rapid rate and tried to pass a car in front. As there was no room to pass at that point he drove his car onto the sidewalk, striking the women and smashing the axle of the other car.

An Exhibition of So-Called Skill.—A driver near Fairmont, Minn., who wished to let people know he had a car, when directly opposite a man and woman who were driving a team, opened the cut-out and frightened the team so that the occupants of the carriage were thrown out and injured.

Autos Cost $1,000,000,000 Yearly.

Here are some statistical extracts from Reginald L. Foster's "I Am King Auto:"

Automobiling costs the United States $1,080,000,000 annually.

To run 2,000,000 cars a year takes 1,000,000,000 gallons of gas worth $130,000,000. (Here's where John D. and the Standard Oil smile expansively.)

Twenty million additional gallons of lubricating oil costs $8,000,000 a year.

Digitized by Google

Tires? Twelve million of them wear out every twelve months, and use up another $192,000,000, figuring tires at only $16 each, a low average.

Automobile accessories—allowing $50 to a car—calls for an outlay of $100,000,000 annually.

Garage expense, $50 a year for each car, eats up another $100,000,000 in one year.

Figuring $50 for each car (if economical repairing is done) and still another $100,000,000 is spent.

Added up, it totals $630,000,000—doesn't it? Some money!

There were 600,000 new automobiles bought last year, costing all the way from $375 up to $10,000, some costing even more.

Call the total roughly $450,000,000.

Now add it all up—just $1,080,000,000 for automobiling.

A thousand millions spent on king auto!

Farmers own 70,000 cars in little old New York State, by gum!

Corn-blessed Kansas has 50,00—averaging in 1914 a machine to every eighth family.

One town of only 200 population in the champion farm state of them all, Iowa, has 77 licensed machines (and $3,000,000 in the village savings banks).

Two millions of cars! One to every fifty people in these United States, seventeen for every railway locomotive, twenty-eight for every passenger coach.

Ford Car Speed Changing.

In coming down from high to slow speed on a hill do not let the engine race. Close the throttle just before you push the pedal forward, so that when you reach free-engine point the engine will be only just comfortably turning over. Engage slow speed, and then gradually open the throttle as far as is necessary to carry you comfortably on. Do not try to rush a hill on slow speed. If you race the engine between high and slow speed, you will engage slow speed with a jerk that will mean discomfort for all in the car—to say nothing of the engine itself.

In picking up high speed you let the pedal come back from slow, close the throttle a little, and the clutch will then take hold "sweetly." You ought not to jump forward with a bound. If there is the slightest disinclination on the part of the clutch to take up the load, slip it, by pressing the clutch pedal slightly forward again, going right forward into slow speed once more, if both car and engine have lost most of their momentum. It ought to shock your mechanical sense to feel the engine laboring in the effort to pick up the clutch. Another point—not so important. Retard the spark slightly when picking up the high speed, advancing it as you get way on.

How He Found the Trouble.

From H. B. Hill, Illinois.—Three years ago I bought a second-hand car and had my first experience with it. This old machine has a history that would interest every reader of the Automobile Dealer and Repairer, and is now in good running order after many thousands of miles and will make many more with the usual care which any car needs to keep it going. I will relate a circumstance which may help a brother. I put a new magneto and coil, a dual ignition system, on about two years ago, and all was well for a good while and then the battery side of the system failed. I put in new cells and traced all the wiring but no spark. I wrote the maker of the magneto about my trouble and was advised to send it to their service station for repairs. They were also very kind to me to send me their descriptive circular and instructions for installing and operating. And in fact when I studied their illustrations and instructions I fixed the thing myself. I have learned long ago that most of these troubles are some little simple thing. I found my trouble in the switch. One time it was the fault of the maker. In attaching the switch assembly to the coil it was not set square with the terminals, which are imbedded in the bakelite of the coil housing. When the battery was switched on the lever would turn barely far enough for the corners of the connections to touch. While on the magneto side it would lap over farther than necessary. So I gave the switch assembly a little turn in the direction of the battery side and my trouble ended. You see that when the switch was new and tight it would hold firm enough to make a very good connection, but it soon became loose enough to drop away from the terminal and break the circuit. I hope this may assist some one in solving their ignition trouble.

Two Cycle Engines.

From N. G. Near, New York.—In connection with Charles E. Duryea's rejoinder, page 36 of the November issue, I am inclined to argue against him on his claims for greater efficiency for the two-cycle engine. I have tested two and four cycle engines in testing laboratories and invariably the four-cycle engine shows greater economy in fuel consumption. It has been shown mathematically that the four-cycle engine should be more efficient, and it is.

Two-cycle engines "work," true enough. They are simpler than the four-cycle, they cost less, they weigh less per horse power, etc.; but it has been found thus far that it is more economical in the end to pay a little more for the four-cycle type. I disagree with his last two sentences, which read:

"About that same time people will also ask why we should muss around with water and radiators when the air finally must absorb the heat anyhow and when the air-cooled cars are holding all records for economy and efficiency? The only answer is PREJUDICE."

I do not think it is prejudice which calls for water cooling. In steam engine power plants, for instance, condensers are invariably cooled with water and not with air. In many cases "air finally absorbs the heat anyhow," even in power plants, but the water must first be sprayed into the air in order that its radiating surface may be made as large as possible to bring the temperature of the water down to the proper point again.

Air is not so good for cooling "intense heat" as is water. That is a well-known engineering fact. Water is a better conductor of heat. Put your hand in air that has a temperature of 32 degrees Fahrenheit and it wont' feel so very cold. Then put your hand in water of the same temperature and it will feel cold. Why? Because water is the best conductor.

Cleaning the Ford Crankcase.

Either run the front of the car up a steepish bank or lift well up with the jack under middle of front axle. Then stop the engine. The result will be that most of the oil will drip towards the lower transmission cover, whence it can be drained by screwing

Digitized by Google

out the drain plug you will see in the crankcase cover.

A more thorough way is this: Tilt the car, as described above, and stop the engine. Then pour in through the breather pipe a gallon of kerosene. Then turn the starting-handle vigorously for some minutes—the longer the better. Then open the drain plug as described above. The sluicing with the kerosene has a very cleansing effect, though the efflux is correspondingly more filthy. Let the kerosene drain away till no more drips. You do not want your next charge of lubricating oil diluted with kerosene. It is not a bad thing to leave the engine dripping all night, replacing the plug, and pouring in a new charge of oil next morning.

If you want to be very thorough, remove the lower transmission cover after the kerosene has dripped out, and wipe off with a rag all the dirt you will find deposited in the sumps in the cover. (The sumps are the three shallow depressions.) There is another sump just inside the crankcase itself—not removable with the cover—which should also be wiped out. Generally, quite a little deposit of dirt will be found in each of the four sumps.

The removal of the lower transmission cover is, however, not essential, providing you tilt the front of the car up well. If you do not, the dirt will be trapped by the sumps, and so will not run out of the hole when you remove the plug.

In replacing the plug, screw up as tightly as you can. If there is leakage here, you will lose oil on the road without knowing it, and that would be very serious. A big-end bearing might easily run through loss of oil.

Protection from a Cold Draft.

From E. C. McCall, New Jersey.—In the 1915 Ford cars there is quite a gap between the windshield and the top. This produces a draught which is very uncomfortable when driving on cold stormy days with the top up. I made a filler for this space from an old tire cover. One edge of this tire cover contains a light steel band about ¼-in. wide, sewn inside the cloth. Back of this edge are a number of

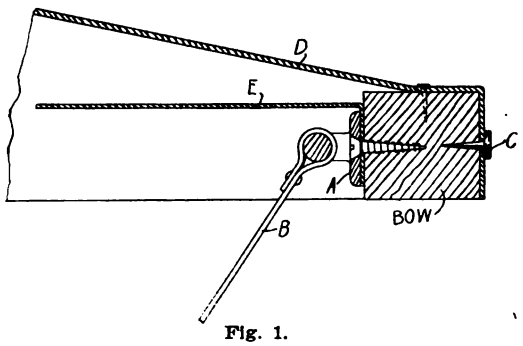

Fig. 1.

"glove" fasteners. These are meant to press into "knobs" which are attached to the other edge of the tire cover, thus holding the cover in position around the spare tire.

First of all, fold the top down. Then take out the screws which fasten the two small iron brackets, A, as in Fig. 1, to which are fastened the leather strap B, which hold the top in position. These are the two short straps with hooks at their outer ends which fasten to the windshield when the top is up.

Then carefully remove the black headed nails, C, which fasten the leather strip around the front of the top bow, also the small tacks which fasten the top material D, to the front bow.

Stretch the tire cover E, across the bow, fastening it at each side of the bow by means of the iron brackets A, taking care that the leather side of the tire cover will face downwards when the top is up and that the edge with the steel inside shall stretch across the top of the windshield E, as shown in Fig. 2. Pull as tight as possible before putting in the screws. Fasten the tire cover to what is the top side, G, of the front bow when the top is up, by means of tacks. Before doing this, cut off the sur-

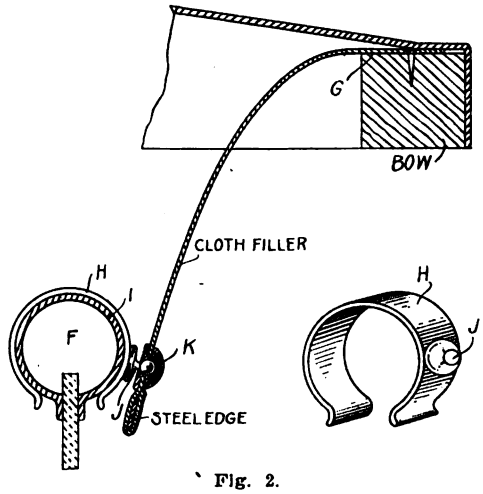

Fig. 2.

plus cloth of the old tire cover, making it fit all around the front edge of the bow. Put back the top material carefully. Make or buy four brass clips, H, which clamp around the upper bar, I, of the windshield.

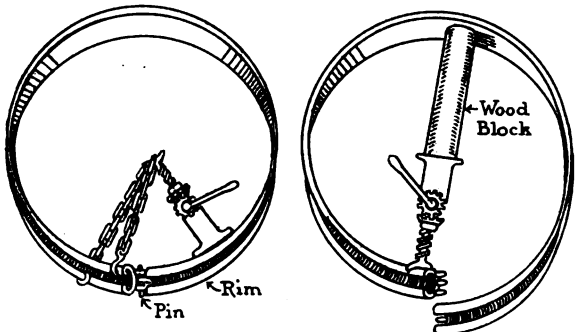
From the tire cover cut out four "knobs," J, mentioned in the first part of this article and solder them firmly to the brass clips, H, as shown. Arrange the clips on the windshield so that they come opposite to the "glove fasteners," K.

When the top is up, push the fasteners into contact with the "knobs" on the clips and you will find that very little wind or rain can blow through at this point, nor will the filler interfere with the side curtains or the leather straps which hold the top in position.

Care of Batteries.

From E. G. Miller, Ohio.—We read with interest your paper and note the increasing number of storage battery problems that are being put up to you. We have the Willard Service Station for Warren, Ohio, and repair and recharge 90 per cent. of the batteries in this county. The greatest difficulty with the battery question is to get the average car driver to understand and properly care for his battery. We are trying to educate our customers to realize that while they have a big giant in a little box, yet he must be fed and cared for in a proper way, if they expect to get work from him. We have had storage batteries brought to us that had been filled with a solution of sal-ammoniac, one with muriatic acid, and another (the battery was almost exhausted), so the man put a wire across the terminals; and time and again batteries are brought in that have been reversed by some careless fellow in recharging. Battery cranking is a great convenience. I don't suppose the pleasure car will ever be without it, but the car user must realize by expensive experience if

Digitized by Google



in no other way, that his battery is a costly part of the car and must be carefully used, intelligently repaired, and recharged when that is necessary. We give free distilled water and free battery inspection and (hydrometer test) to all car owners.

Just a Woman's Way of Thinking.

From Mrs. G. G. Conley, New Jersey.—I was reading the last number of your magazine with pleasure and thinking it was one of the best, when I came to the article about "Women Drivers." It was bad enough for a judge to say "women are unfit to drive an automobile." You took exception to that. Further on you said you never saw an automobile coming with a woman driver, but you have a feeling of apprehension. Now that is not the way to feel. I have a drive to our farm, 22 miles each way, and I get very much annoyed. The road is very much traveled, and a good part of the way it is very narrow. I have a fear of a smash-up or of going off the awful side and back, just because the men drivers crowd a woman off. They keep to the smooth road piece. True, they may calculate within a few inches, but who wants to take that risk? I do not blame the farmers for taking advantage of having a heavy wagon, to give the automobiles all that ought to come to them. Two wrongs do not make a right, I know. The Ford owners, as a rule, cut in and pass in ahead at places. They think they have a car to beat anything.

For Tight Fitting Rims.

From W. J. Baker, Ohio.—A few months ago you had an article regarding using a screw jack to force a tight fitting rim on a wheel, which I find very

To seperate Rim To bring Rim together

useful. My rims go on the front wheels very easily, but I always had a great deal of trouble, hard work and long time consumed in getting the rims on rear wheels, but thanks to the tip published in your journal, I can now get the rims on without difficulty. Some of your subscribers may have had trouble in both separating and getting together split rims, especially if they are similar to the "Kelsey Split Rim," the two ends of which are made like an ordinary door hinge, with three eyes on each end, through which a locking pin goes. After considerable study and experimenting I devised a scheme for pulling the two ends of the rim apart. I use a screw jack, placing a chain over top of the jack. The chain is provided with a hook at each end which hooks over the two edges of the rim, and no matter how badly the casing is rusted to the rim, by use of a jack one gets an even pull on both sides of the rim and the latter comes apart very easily. For getting the rim together again and the eyes on each end of the rim interlocked, place the jack on a piece of wood and a few movements of the jack handle will force the inside end of the rim into place. I send you a crude drawing, which together with my explanation, will make the modus operandi understandable.

CONDUCTED BY M. KEITH DUNHAM, OXY-ACETYLENE ENGINEER, 50 CHURCH STREET, NEW YORK.

Readers are requested to state their questions clearly and fully, but as concisely as possible. It is hoped the information given will be of general interest as well as of value to each inquirer.

Housing Welding.

From George S. Hathaway, Illinois.—I have had a number of Ford drive-shaft housings to weld but have had trouble in the weld cracking when cooling. I can't seem to locate the trouble, as I am careful in letting the weld cool slowly.

Answer.—Usually a break of this character occurs in the tubing, just where it enters the malleable housing. In assembling this, the manufacturers rivet the housing to the tube and then braze it. If you will note the break carefully, you will probably see the brass of the brazing material is either in the break or in close proximity to it. Now steel melts at around 2,500; the zinc of the brass volatilizes, i. e., it turns into a gas at a very much lower temperature than this and it is this fact which prevents making a successful weld, as the steel must be free from impurities. Never attempt to weld iron or steel which has been brazed unless you can get all the brazing material cleaned away before starting to weld—something usually impossible.

In breaks of the character you describe, I would suggest that you cut off the tube back two or three inches from the break and weld on a new piece of tubing, which may be seamless tubing of approximately the same gauge or extra heavy wrought iron pipe; then remove the broken small piece from the housing and re-rivet and braze into the housing the end you have welded on to the tube or instead of riveting you may bore out the holes in the housing a larger size, slip the tube in and make a bond by brazing the tube to the housing with tobin bronze, through the old rivet holes in the housing which you have enlarged.

E. D. Lovejoy, Maine.—I have had a welding outfit for over a year and on some work have been very successful but I have a great deal of trouble with contraction cracks. I don't seem to be able to tell whether or not an article must be heated before it is welded. Is there any rule in this respect I can follow?

Answer.—Simply remember that cold metal must occupy a smaller space than hot metal—therefore, study the break to see if there is an opportunity for at least one end to expand and contract freely, that is, that it is not attached to or a part of the article. A lug on a crank case or a crankshaft or a front axle are examples of where no preheating is necessary to prevent contraction cracks. Breaks in the body of a crankcase, in the water jacket of a cylinder, etc., require preheating for the reason that when the weld cools the case will be distorted or will break, simply because the area you have heated by

Digitized by Google

welding must be a smaller area when it is cold. So to offset this, we warm all sections which are to be affected and so expand them all over; then in cooling they cool and contract equally.

This isn't a hard and fast rule but it is the only one which the student of welding should recognize until he thoroughly understands expansion and contraction. Sometimes it is possible to overcome contraction strains by the use of wet cloths, thus limiting the stress to a small section; sometimes by bending or cutting, but these methods should not be employed until the reasons are understood.

It is necessary to treat each repair job individually, as hardly any two are alike. A little forethought will usually result in saving the necessity of second guesses.

Crank Shaft Welding, Etc.

From Frank Erxleben, Indiana.—Your letter was very interesting, and one thing you seem to have grasped much better than your earlier correspondence indicated—expansion and contraction. I fully agree with you as to the futility of depending upon V blocks to prevent contraction. It can't be done. At best they are a help in lining up and this is as much as they should be expected to do in the line of crankshaft welding.

Now about your filler rod for crankshaft welding and your statement that Norway iron will not make a strong weld. As a matter of fact, Norway iron should not be used on crankshafts but as near as possible, a rod of the same material as the shaft. Norway iron is very ductile, that is it bends easily, but its tensile strength is low. Because a crankshaft must stand a constant series of strains and remain straight and true, just the opposite is necessary. This strength is obtained by a higher carbon content, by the addition of alloys such as nickel, vanadium, etc. The thing which will bother the welder the most is the carbon content and where this is extremely high the steel is practically unweldable, due to the burning of the metal and the absorption of gases, making it porous. But this is a condition very rarely met with in crankshafts and as a rule good welders can handle crankshafts and be quite certain of their results. Your trouble seems to be lack of experience, though it may be impure gases or a poor welding torch or lack of self-confidence. But don't consider a thing impossible if the other fellow is doing it every day—and it's a pretty good plan not to even if he isn't, for the impossible of to-day is the commercial success of to-morrow.

To argue that an acetylene weld made upon a shaft is as strong as the original was (if it was free from imperfections) would be foolish. The shaft is heat treated, forged, etc., and the weld is simply a casting. The strength of the weld, if there is no chance to reinforce by adding more metal, will probably be from 80 to 90 per cent. as compared with the original metal but in 99 times in 100, this is strong enough. Here is a case where theory and practice clash, for in the former instance, if the shaft was not strong enough to hold and the weld is weaker than the shaft, it would seem the height of foolishness to depend upon the weld, but how many shafts did you ever see broken except through an accident? Perhaps the bearing burned out, timing may have been wrong, connecting rod let go or the wrist pin break or just possibly perhaps there may have been a crack in the shaft. Crank shafts are built much stronger than they really need to be, if nothing goes wrong. Engineers call this condition "the factor of safety." The weld merely reduces this factor and for all practical purposes, crankshaft welding, if properly executed, is perfectly feasible.

You say in your letter "you can't puddle the job long enough to combine the metals." Don't ever try to puddle steel with a welding torch. You can puddle aluminum and cast iron but never steel—not and have any strength left in the metal. To do this you would have to use a tip much too large for the thickness of the metal and the result would be burnt, porous metal. Steel is sluggish, it solidifies almost instantly the flame is removed (unlike cast iron) and the operator must use care to see that the metal is thoroughly fused by a circular motion of the torch or a zig-zag one of the rod, not allowing the flame to remain one instant longer than is necessary to effect the bond between the rod and the weld.

If you believe in hammering the weld, be careful that you do so at the welding heat. Personally I do not think it necessary or advisable and it is very likely to distort the shaft to such an extent as to prevent truing up. See answer above regarding text book.

Welding Cast Iron.

From E. Baumann, New Jersey.—Could you give me some advice as to welding cast iron? It seems that when I weld it, my weld does not hold, although I get my metal flowing before I apply my filling rod. The weld, when it breaks, looks to have a shine to it. Is this the fault of poor flux or do I not get my metal flowing enough? I have good luck with steel and aluminum. Also let me know if there is a good welding instruction book on the market.

Reply.—Your trouble may come from several causes but I hardly think that the flux is responsible and I would try a few other sources first before changing the flux. Remember that the welding rod must be of a special alloy, high in silicon, to effect a successful cast iron weld. If you use any old casting as a filler, the weld would be extremely brittle and have a bright appearance such as you describe; therefore, be careful of the welding rod and purchase it only from reputable acetylene welding supply houses. Next be careful that your weld cools slowly—by this I mean that before you start welding, the casting, or at least that part of it around the weld, should be at a red heat, the weld executed whlle it is still hot and then the casting placed back in the preheating fire or allowed to cool in ashes, asbestos, mica or some good non-conductor. If it cools suddenly, the weld will be brittle and have a silvery appearance. So you see that the two principle things to look out for are a good welding rod and slow cooling. Failure on your part to observe either or both of these conditions will result in a brittle weld. It might also be well to add that unlike steel welding, the end of the blue cone of the welding flame must not come in contact with the metal but be held a little distance away, varying with the thickness of the metal. The practice of allowing this cone to penetrate the molten mass would result in hard spots but would hardly be responsible for the conditions you state.

"Autogenous Welding," by Granjon and Rosemberg, is a text book translated from the French. While some portions of it are devoted to subjects which would be of no help to you, the authors have

Digitized by Google

made a deep study of the subject and it is full of information to the man who really is in earnest to get to the bottom of this fascinating and profitable business. But I warn you that it requires real study to understand and not merely a cursory reading. The price is I believe $2.80 and perhaps the publishers of this magazine can get it for you if you ask them.

Some Welding Hints.

I know of no better Christmas present you can make yourself than an oxy-acetylene welding outfit —if you have not already done so.

No other shop equipment will pay for itself so quickly, if intelligently handled. It's one of the biggest ads, if you produce good work with it. A garage or repair shop must be in a position to give service—the owner of an automobile wants to use it, to-day and to-morrow and all the time—and a welding outfit helps materially to keep the car going.

It will straighten that broken frame without the necessity of tearing the car down. It will not only weld all broken parts but will build up worn ones—it's fine for babbitting and simply by the addition of a copper tube, you can burn the carbon out of the cylinders. No garage can well afford to be without a welding apparatus.

Choose it carefully, using the same horse sense you would in the purchase of a car. Some automobiles are sold without equipment—so are some welding apparatus. Others come complete with speedometer and tools and electric equipment. Some welding apparatus are sold with the same ideas in mind. So in the purchase of the welding equipment, read the specifications carefully, the first consideration being SAFETY. Price does not always govern quality. An apparatus may be low in this respect and high in manufacturing ideals or it may be very high in price and very poor in quality. Yet "bargains" in mechanical apparatus as a rule are a pretty costly investment for the user. There probably is a happy medium of price where the manufacturer may sell you a good outfit, give you good service and still maintain a fair profit and this is the type of equipment most suitable for the automobile repair man.

If You Have an Outfit.

If a welding apparatus is already a part of your shop equipment, look it over, with a view of finding out if you are getting out of it the results you should; and if you are ready to use it to the best advantage in overhauling.

Are the regulators in good condition? Remember that SAFETY FIRST demands that the oxygen regulator especially is in good working order; since its failure to operate properly may result in a serious accident. With the valve on the tank open, does the hand on the dial of the low pressure gauge creep ten or fifteen or maybe twenty-five pounds? If it does, this is a sure indication that the seat is damaged and needs attention. If you understand its construction and have new seats, you may renew this yourself, being careful that no oil or grease gets inside the regulator. If you don't understand the regulator, send it back to the manufacturer for repairs.

Is this regulator equipped with a high pressure gauge to indicate the tank pressure? If it isn't, get one, and be certain to get the best for quality is especially to be desired in this instance. It's a nuisance not to know when the tank is getting empty or to know how much gas you have used on a job. The high pressure gauge keeps you advised. Without it, you can simply guess.

Are you using lighting cylinders for the acetylene supply? Don't. The gas costs considerably more and a steel weld is likely to be very weak, especially if the metal is heavy. Make arrangements to secure the regular welding cylinder or if you must use lighting cylinders, connect three or four on a mainfold. Space is too limited to go into details regarding this feature but many good welds have been spoiled because the operator used lighting cylinders and inasmuch as welding cylinders may be easily secured and the gas cost considerably less in this form than in lighting cylinders, this fact alone should prohibit the use of lighting cylinders.

Look over the hose, especially where it is clamped to the regulator or torch connections. Be sure that it is tight and unbroken. If you use ordinary wire, instead of hose clamps, be sure that the hose isn't cut. There have been serious accidents due to the hose breaking—don't lose sight of SAFETY FIRST.

See that you have a proper range of interchangeable tips, to insure welding thin as well as heavy metal. If the tips are burned or ragged, get new ones—good welding is impossible with tips which are not in good condition.

If the torch flashes,—that is, if the gases burn back to the mixing chamber easily—return it to the manufacturer for repairs. Modern developments in the construction of a welding torch make this practically impossible.

Make sure that you are properly equipped—that you have a welding table, made from angle irons or gas pipe, welded together, with a fire brick top—that you have on hand a sufficient supply of welding rods, purchased from a reputable supply house, the proper fluxes, etc. Good welding may only be obtained with good welding materials and it is poor economy to purchase the cheapest in this case, when the best in the long run is the lowest in price.

Workmanship is the most important of all. Practice, practice and practice—not on your customer's job, but on scrap material. Don't figure that a thing is impossible until you know. And don't conclude that the other fellow's experience is necessarily final. He may have succeeded in welding something through luck and then described his luck for your benefit or he may have fallen down and because of his limited experience, stated that because he couldn't do it, it was impossible.

Oxy-acetylene welding requires "heady" work. If you are capable of diagnosing the troubles of the various parts of an automobile, you surely have the brain to master welding difficulties. Perhaps you need elemental knowledge and if you do, get it through your trades paper.

The Fan Belt.

If you find yourself with your fan belt broken, and have no spare one, there is no harm in driving without the belt if the weather is cool, and you drive slowly, so that the water does not boil, and if, further, you stop if it does boil, and give it time to cool. In cold weather you can drive without the fan altogether. Indeed, when it is freezing, you often get more power and better running by doing so.

A small compass placed where is it easily accessible, serves to keep one posted as to the direction traveled.

LATHE TOOLS.

Things That Will Permit of a Fairly Wide Range of Work.

It is generally the custom of the small repair shop to send certain pieces of work outside. The greater part of this work could be successfully handled and profitably if the shop equipment included the necessary special machinery, but much of the work can

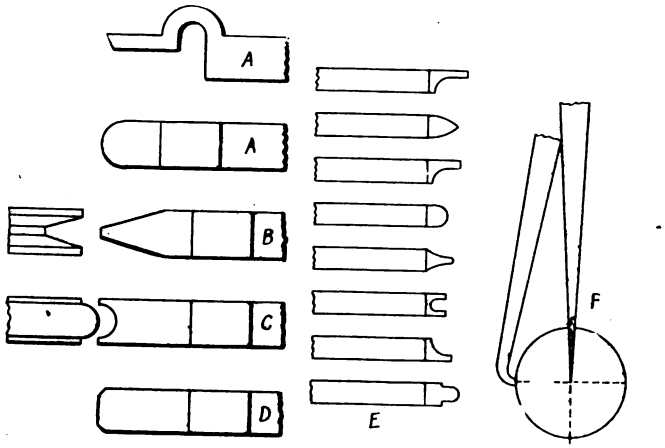

Fig. 1—Useful tools for the lathe including a spring tool for radius work, finishing pulley, bead forming, finishing iron castings, cutters, etc., and tool for centering cylindrical work.

be accomplished with simple home-made tools. There are many special tools which may be utilized with the lathe, and these are very handy, especially when old cars are being overhauled, and which require a new part that cannot be secured, requiring a pattern, casting and subsequent machining.

The accompanying illustrations show a number of lathe appliances that can be made and will permit of a fairly wide range of work. Those shown at Fig. 1 are the external type of cutters and several of them are decidedly superior to the ordinary slide rest tools, particularly the appliance shown at A, which can be used in radius work, such as turning flywheels, hubs, flanges, etc. The usual method is

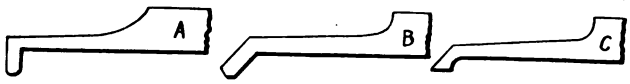

Fig. 2—Home-made lathe appliances: A, internal boring tool; B, finishing tool; C, for roughing out castings.

to rough out nearly to size and finish with a spring tool. An instrument for centering this as well as other cylindrical work is illustrated at F. The tool shown at B will prove handy when turning a groove in a pulley and it can be employed for similar work. The tool at C is useful where beading is required.

The tool at D will facilitate the work when facing a casting. If a cast iron disc, four inches in diameter, and having a bored hole, is to be trued up and polished on one of its sides, it would be bored while in the chuck and then faced up for polishing. The usual way is to finish some castings with hand scrapers, made from worn out flat, smooth files, the teeth of which on both sides have been ground away and the end of the work finished square.

A bar of square steel or iron is clamped in the slide rest, with one end projecting about four inches, at right angles to the lathe centers, and close to the work to be scraped. The file is securely fitted into a handle, then held with the right hand, the other resting on the steel bar in the rest. It is suggested that a piece of leather be placed under the scraper, when being used, to prevent chattering of the tool. The tool is presented squarely to the rotating work until a fine surface is obtained, after which it can be polished easily with emery cloth and oil. This tool can be used in place of a scraper and will accomplish the work much faster than for ordinary turning, and by taking a light cut it should leave nearly a polished surface. The lathe should be run a trifle faster than with ordinary turning.

For boring in cast or mild steel the tool shown at Fig. 2, A, will prove handy while the one shown at B will be found to be useful in finishing the bore when cast iron is being worked. When machining cast iron, if the piece has a cored hole, it is advisable to displace as much of the core sand as possible before trimming out the interior. Frequently it is difficult to get below the skin of the metal, as it quickly takes off the cutting edge of the tool. This trouble may be overcome by first facing up the casting, then employing a boring tool shaped like that illustrated at C. The front of this tool is started into the clean metal on the face side of the work, and as it progresses by means of the hand of mechanical feed, it will break away the hard skin of the casting, facilitating the boring work.

A holder for the tools described is shown at D, Fig. 3. It is constructed from a piece of ½-inch

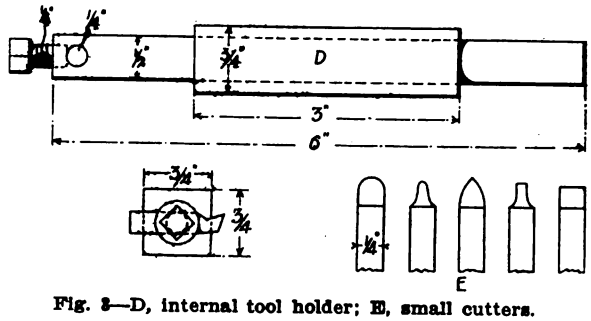

Fig. 3—D, internal tool holder; E, small cutters.

round cast steel about six inches long. A ¼-inch hole is drilled through the metal to take the cutters shown at E. These are made of ¼-inch round steel and are secured or held in place by a ¼-inch set screw. The holder is constructed from a three-inch piece of ¾-inch square mild steel which is drilled through its length and the aperture finished up with a reamer. To enable clamping to the tool bar in the

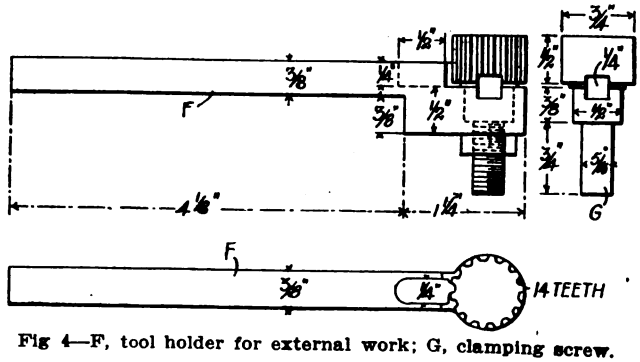

Fig 4—F, tool holder for external work; G, clamping screw.

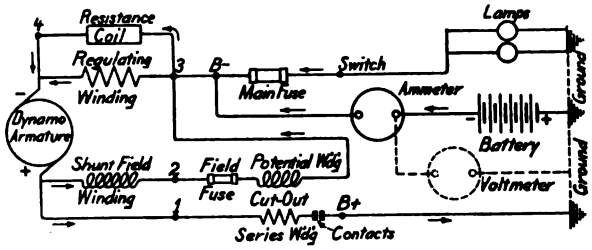
slide rest, make a longitudinal saw cut. The work when completed should be case hardened.

The tool shown at F, Fig. 4, is a forging and is employed for external work. A 5/16-inch diameter hole is drilled through at one end and enlarged to ½-inch diameter, to within ⅛-inch of the bottom. The bolt used for holding the tool is shown at G and

Digitized by Google

is constructed from mild or cast steel and is case hardened. A 5/16-inch thread is cut for ¾ of an inch, and the bolt above the thread is turned to ½-inch diameter and is ⅜-inch long. The overall dimensions of the head is ¾-inch, and 15 teeth are cut around the circumference. To take the square tools shown at Fig. 1, E, a hole ¼-inch is drilled through the center of the holder bolt and filed to take the tools mentioned. When the bolt is placed its teeth engage with the points filed on the holder, and this prevents it from turning when tightening the nut. The combination can be swivelled to any desired angle.



NEW LIGHTING SYSTEM.

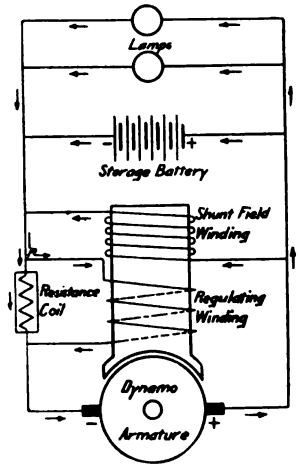
An Electric Outfit That Is Fool Proof and Needs Little Attention.

The Bosch Standard Lighting System, which is now ready for the market, is an efficient, high class product designed to meet all lighting needs on the modern motor cars and motor boats. In producing this system, there has been no effort to meet any previously determined low price and the result is that a purchaser may now obtain for his car an outfit that, while it may appear just a little better than seems necessary, is, in fact, worthy of his entire confidence. The value is unusual and beyond question. The importance of the foregoing can not be overestimated, for to-day the average car owner knows little about the workings of electrical systems, and what is more he does not wish to know; he desires service, and therefore the selection of a good lighting system is of paramount importance.

The modern motor car depends much upon its electrical system—if that be inadequate, unreliable or troublesome, the car becomes a bore and a nuisance until additional expenditures overcome the difficulties.

The Bosch Standard Lighting System is intended primarily for automobile and motor boat service, and consists essentially of but four units, namely, a dynamo, a storage battery, a control box, and a switch.

Circuit Diagram of Bosch Standard Lighting System.



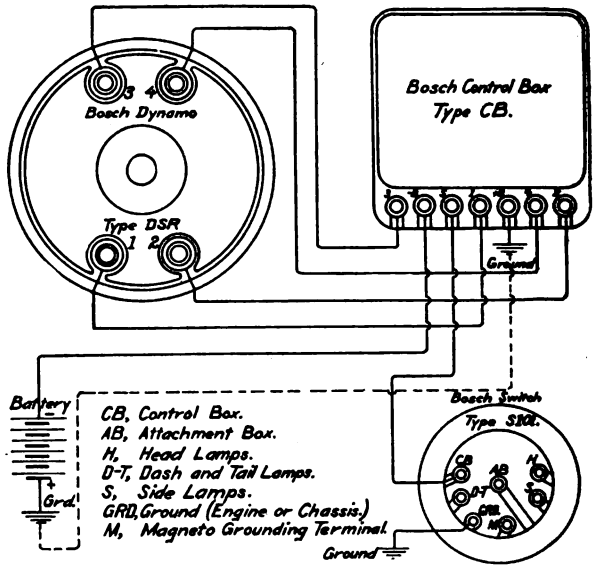


Diagram showing current flow and principle of operation of Bosch Standard Lighting System.

The Bosch Standard Dynamos.

The dynamo is supplied in two sizes, the larger designated, type "DSR 3", and the smaller, type "DSR 103"; the former is rated at 100 watts, and the latter at 80 watts. Aside from the difference in size, however, the types are practically identical, and both are intended to operate in connection with six cell, commonly known as 12-volt, storage batteries.

The type "DSR 3" is designed for operation either at engine speed or at one and one-half times engine speed, and is regularly furnished with through drive. Thus this type of dynamo may be driven direct from the pump shaft on four and six-cylinder engines and, if desired, may be employed to drive a magneto, pump, etc., connected in tandem therewith, as shown in the illustration.

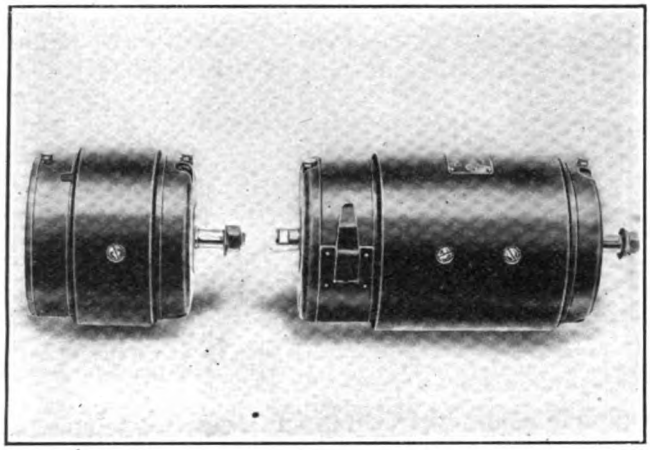
The type "DSR 103" is furnished with end drive only, and is designed to be driven at two and one-half or three times engine speed. This is what is known as the fan type dynamo, and can be mounted directly in front of the first cylinder, using a common drive for dynamo and cooling fan, or it may be mounted to the side of the first cylinder and used with a three point drive, that is, from crankshaft to dynamo to fan, the same drive answering for both the dynamo and the cooling fan. The dynamo drive may be either by gear, coupling, chain, or of belting.

Wiring Diagram of the Complete System. There is no tangle of wires and every terminal is plainly marked so connections can easily be made.

Diagrams of the

Bosch Standard Lighting System

Dynamo Construction.



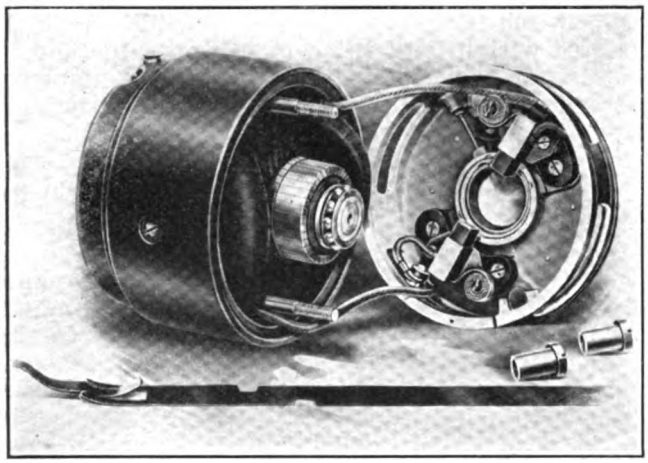
The housing is of seamless steel tubing. To this tubing the two end caps are secured by means of two bolts extending the length of the dynamo on the inside of the housing; when the two bolts are drawn up, the end caps fit the housing so snugly as to make the entire dynamo practically dust-tight, oilproof and waterproof.

The two pole shoes are located diametrically op-

Digitized by Google

posite each other, and are secured to the inner surface of the dynamo housing. Both the shunt field and regulating windings are in one form, and are so arranged that they practically encircle the armature; this arrangement tends to counteract armature reaction, with the result that it is possible to obtain sparkless commutation, or, in other words, to eliminate almost entirely the burning of the commutator and brushes.

The armature is of the laminated type, and as it



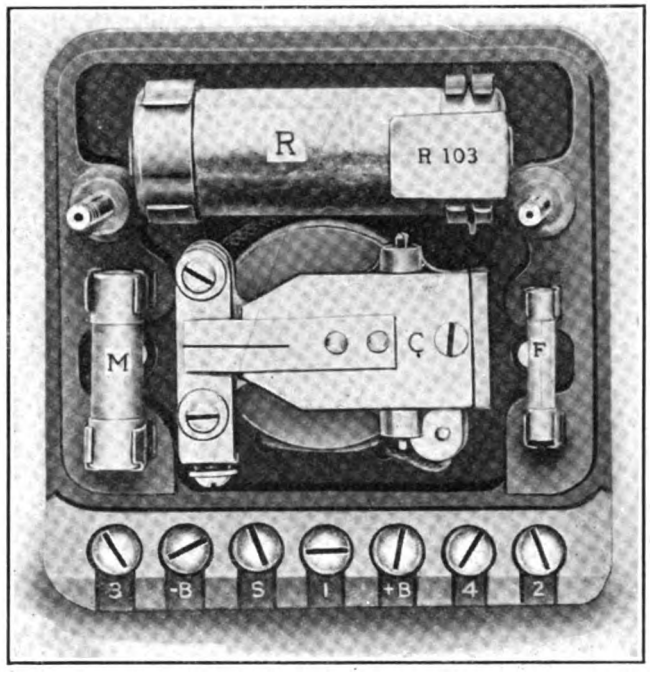
The two styles of dynamo used. The smaller, frequently referred to as the fan type dynamo, is known as type "DSR 103"; the larger, as type "DSR 3".

rotates on large ball bearings at each end, very little lubrication or attention is required.

The two brushholders are mounted upon, and insulated from, the commutator end cap. Each of the brushholders carries a large current collecting brush, designed to afford maximum life; the brushes are held against the surface of the commutator by strong flat coiled springs.

The four external connections are placed in the

Showing how readily the entire workings of the fan type dynamo, "DSR 103", can be brought to view. This accessibility is an important feature.



shaft end cap of the dynamo, and insulated therefrom, and are so arranged that they are most accessible. The dynamo terminals are numbered "1" to "4" to facilitate the wiring of the dynamo in accordance with the diagram shown.

The opening in the commutator end of the dynamo is enclosed by a recently perfected garter cover with a special catch, which allows of the commutator and brushes being easily and quickly exposed for the purpose of inspection and cleaning.

Principal of Operation.

In automobile lighting the problem is to supply a system which, irrespective of the wide range of operating speeds, will deliver an output capable of maintaining the battery at its most efficient point, and also carry the car electrical load, namely, the current consumed by the head, side, dash, and tail lights.

Dynamos which are adaptable to automobile lighting, have certain characteristics which have to be dealt with in order to make them operate satisfactorily at the varying speeds at which they are driven. One characteristic in particular which must be controlled is that the higher the speed at which the dynamo is driven, the higher rises the voltage that is generated, and this in turn means a higher current output. The rising voltage characteristic is due to what is called the shunt field excitation, and in order to control this feature, it is necessary either to vary the resistance of the shunt field circuit, or

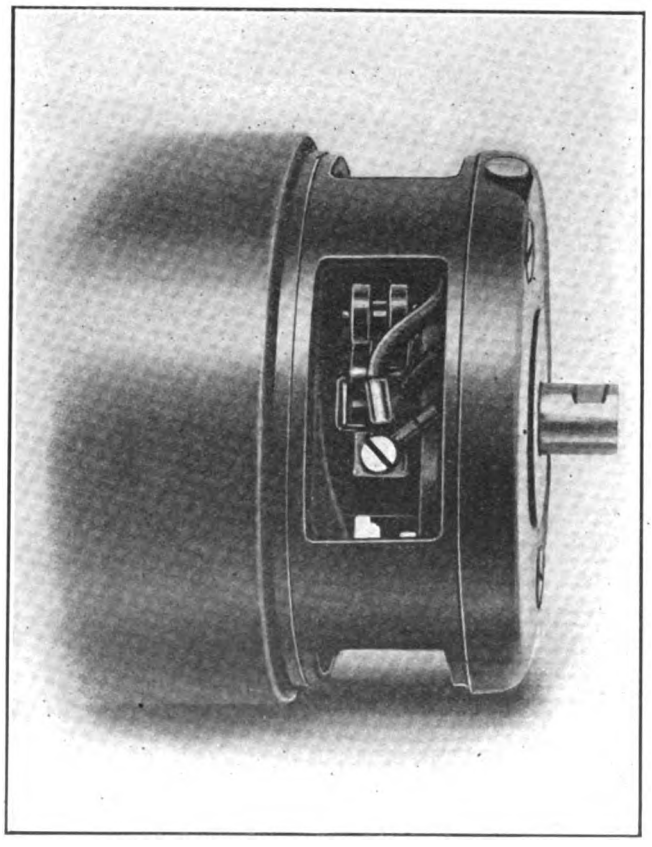
Bosch Standard Lighting System Control Box. Type "CB 101", with cover removed, C, cut-out; F, field fuse; M, main fuse; R, resistance coil.

to introduce a counteracting or damping effect upon the magnetic lines created by the shunt field.

It is possible to use many different methods in order to attain the desired result. The Bosch way of controlling the dynamo output is to do so automatically by means of a second winding on the field poles, this winding to be so arranged in relation to the shunt field winding that when a current is allowed to flow through, it has a regulating effect on the lines of force created by the shunt field winding. The result is that the dynamo output is held at a practically constant value, regardless of the varying speeds at which the dynamo may be driven.

With this method of regulation it is possible to keep the battery condition always as it should be, inasmuch as the voltage of the system is determined by the battery, and when current is drawn from the battery, due to using the starting motor, or burning the lights when the engine is at a standstill, there is a corresponding decrease in voltage, and as the controlling resistance is proportioned to the current output, it will allow of a sufficient current flowing into

Digitized by Google



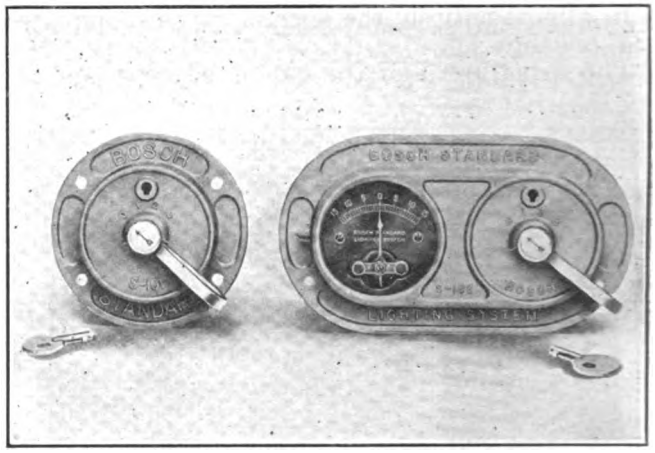
the battery to charge the latter to its most efficient operating state. It is also possible to carry the full lamp load of the car without assistance from the battery, the design of the dynamo being such that it delivers sufficient average current to take care of the lamps even when driving at slow speed. Practically the only call upon the battery is when the starter is operated, or when the lights are used with the car at a standstill.

The Control Box.

The control box, type "CB 101", is intended for mounting on the engine side of the dash, or in any other place equally convenient for the purpose of inspection on the part of the operator. Incorporated in the control box are the automatic cut-out, the resistance coil, the main fuse, and the field fuse.

As regards the automatic cut-out, this is provided for the purpose of automatically connecting the dynamo to the battery when the dynamo voltage is at a value sufficient to cause the battery to charge, and automatically disconnecting the dynamo from the battery when the dynamo voltage drops below that necessary for charging.

The field fuse is intended to protect the dynamo



The dynamo permits quick and easy access to the brushes and commutator; a spring band encircles the so-called "business end" and is easily removed.

when, through accident, one of the cables connected to the battery becomes disconnected, this in turn causing an abnormal rise in voltage at the dynamo terminals; under such conditions, the rise in voltage of the dynamo causes the field fuse to melt or "blow", thus opening the field circuit and resulting in the dynamo ceasing to generate.

The terminals are so placed that they are readily accessible for the purpose of making connections or inspections, and each is plainly marked to indicate the respective dynamo, battery or switch terminal with which it is to be connected.

The Switch.

Two styles of switch are provided for use, one designated type "S 101", the other known as type "S

The two styles of switch which can be supplied. Type "S 101" is without ammeter; type "S 102" is with ammeter. Both switches incorporate a locking device.

102" and combining switch and ammeter in one unit. The ammeter affords a visual indication of whether or not the entire system is operating properly, and the inclusion of this very useful unit in all lighting systems is strongly recommended.

Both switches are provided with a locking arrangement. The switch may be locked and the key removed in any of the four switch positions, and as the magneto also is controlled by the "S 101" and "S 102" switches, the removal of the key in the "Off" position of either switch locks the ignition also, thus forestalling all possibility of unauthorized use of the car.

The switching combinations are such that it is possible to meet all driving conditions. Both the "S 101" switch and the "S 102" switch should be mounted within easy reach of the operator and, in the case of the combination switch and ammeter, this should be so placed that the meter may be readily seen at all times.

For convenience in making connections, all terminals are placed at the back of the switch and are lettered as shown in the wiring diagram.

The Battery.

For use with the "DSR" types of Bosch Dynamo, the battery should be of the six cell, commonly known as 12-volt type, and for average requirements should be 50 ampere hour capacity.

The battery may be supplied by the user himself, or if desired, suitable batteries will be furnished by the Bosch Magneto Company upon request.

As previously mentioned, all terminals of the various units are numbered and lettered, thus making the wiring so simple that it is possible for even a novice to make the proper connections without difficulty. The extreme simplicity of the connections between units can be noted by reference to the accompanying wiring diagram.

The connections from the switches to the current consuming units are equally simple, and as readily understood as those between the main units themselves; the connections are tabulated in the wiring diagram.

In order to assure maximum protection for the

Digitized by Google

connections between the dynamo, control box, battery and switch, as well as for the connections between the lamps and other current consuming units, it is recommended that rust-proof armored cable be used. Such cable may be obtained from the Bosch Magneto Company.

All accessories to the lighting system, such as attachment box, lamps, etc., may be supplied by the user to suit his individual tastes. However, the Bosch Magneto Company is prepared when requested to furnish all requisites to complete the lighting system—attachment box, lamps, cable, terminals, etc.,—and details regarding such accessories will be gladly furnished to those interested, upon request.

The entire system is so designed, and all Bosch units so substantially constructed, that aside from periodic oiling of the dynamo bearings and inspection of the battery cells, very little attention is required.

CAR DRIVING.

Address of Francis M. Hugo Before the New York Y. M. C. A. Auto School.

It is not too much to say that the future of motoring largely depends upon the behavior of motorists and their drivers toward the public. As fewer owners of large touring machines drive their own cars nowadays in proportion to the number driven than used to be the case, it is, therefore, mainly the behavior of their drivers on the road that is important. The subject of the training of the motorman is consequently worth much attention.

For the past few years, those who drive motor cars for the wages have been called "chauffeurs," a word against which a protest should always be made on the double ground of etymology and nationality. To begin with, the word in reality means "stoker." On the footplate of a French locomotive the driver is called a "mecanicien," while the fireman is designated as the "chauffeur." In the case of motor cars propelled by steam, the word "chauffeur" may thus be held to be remotely correct, but on the ordinary car propelled by the internal combustion engine or by electric power, there is no sense in the term.

The motorman, as he will, therefore, be called, is very often the subject of much discussion and sometimes of irrational abuse. Of course, there are black sheep in his profession, as in every other, but one is glad to place on record that black sheep were far more numerous five years ago than they are now. No one who observes without prejudice the behavior of motor car drivers in New York City and elsewhere can help being struck with the careful way in which private motor cars are now driven, the neatness and cleanliness of the men themselves and the vast improvement which has taken place in their general manners. Formerly, it was thought to be the highest mark of the profession that a motorman should be dirty in every respect, and a greasy cap, black hands and face, oily clothes and as a rule a half smoked dirty cigarette in the side of the mouth, combined with a contemptuous scowl at every passerby, was not an uncommon sight.

This state of things, however, has changed for the better. Occasionally a specimen of the old type of driver is met with, and even now the habit of cigarette smoking when in charge of a car is supposed, by the younger and less intelligent men of the profession, to confer an air of knowledge coupled with disdain. In course of time this form of swagger will die out also. The manners, moreover, of many motormen to their employers and to their fellows have not in the past been all that could be desired, but as stated before their general behavior is markedly improving, and it must be remembered that, with all their faults, motormen are greatly superior in intelligence to most of their predecessors.

It need hardly be noted here that much depends upon the way the motorman has been trained. When automobiling was just beginning the only person available who even half knew the somewhat complicated machine of the early days was the mechanic trained for a few months in the shop where the car had been manufactured. He was master of the situation because he alone had a working knowledge of its parts. No one in those days thought for one moment of a motorman from the viewpoint of good driving. The owner of the car, above all, desired to possess a good mechanic, for breakdowns were numerous and varied and half of the expenses of motoring were necessitated by renewals of parts or adjustments due to ordinary wear and tear. Nowadays, serious or even insignificant breakdowns are rare, and there is hardly a first-class make of car in the market which will not run many thousands of miles without anything being necessary in the way of repairs and adjustments. Those which are necessary are, moreover, of the simplest kind. There is no longer, therefore, the same necessity for the motorman to be what is called a really good mechanic, so long as he understands the general principle on which the engine works and the arrangement of the gears.

The majority of motor car owners have, therefore, changed in their requirements. They do not want a man who is primarily a skilled mechanic, but they do ask for a skillful driver, and in this wise alteration in the chief qualification demanded lies a good deal of the reason for the great change which has taken place in the behavior of the motorman in the city and out of it. It may be remarked that an excellent mechanic is not necessarily a good driver, though he may be so in certain cases. What is required in the driver besides the general knowledge of the machinery is a knowledge of the customs and courtesies of the road and the habits of traffic, the possession of the qualities of alertness, foresight and consideration for others. Above all, he should have a temperate frame of mind, an abstinence not only from drunkenness, but drinking in any but a most moderate sense. The driver of an ordinary wagon is conspicuous by his ignorance of the way to drive and his want of consideration of other traffic. He is the most persistent moving obstruction which exists. The motor car driver on the other hand, has to be the best driver on the highway if he is to drive without offense to the public and danger to them and himself, for he has to conduct a vehicle which is more valuable than any other and far and away more speedy though more handy and, therefore, which meets and overtakes other vehicles many times more rapidly. In addition to these, he has to consider other dangers of the road to which other vehicles are not so liable and which come from the construction of its surface.

The complete motorman should have a working knowledge of the different materials of which roads are made, of their comparative tendency to cause skidding, and of the perils which arise from badly

Digitized by Google

laid street car tracks. He must know and continually practice the courtesies of the road and learn its manners and customs. He must be observant and realize that children hanging on the rear of wagons are liable to drop off suddenly and run across his path. He must be on the lookout for pedestrians, stupid, drunk or deaf, for wagons on the wrong side of dangerous corners, and to be prepared to find vehicles in charge of sleepy drivers who will often do the wrong act on awakening. It will, therefore, be seen that the motorman to be really good has to be the best driver on the road and that the standard demanded must necessarily be high. He must possess exceptional qualities as compared with the horse driver. The question is, therefore, all important what are the best methods of training such a man.

There is no doubt that many of the schools which are teaching elementary mechanics to the would-be motorman are excellent in their way. But there are many which are nothing but frauds. Reports have frequently been made to the State where a man has complained bitterly of having put down $25 or $50 in return for which nothing but most elementary instruction has been given and this often in the worse possible way. There has been no teaching in traffic rules or on the road, or, if given, so little as to be no use. But at other places pains are taken, and, by diagrams in the class room and practical teaching on the road much has been taught.

There are nowadays handbooks galore which teach the construction, repair, the common faults and likely failings of the gasoline engine from A to Z. The mechanical side may, therefore, be said to have been amply provided for.

But this is only the less important, though necessary, part of the training of the modern motorman. What is really needed is that some school should teach manners on the road and the habits of traffic, in short, train its men for the road. There should also be problems of difficult but ordinary situations in traffic set in a written examination, the correct solution of which would be obligatory before the motorman could be said to be properly trained. It is not, perhaps, easy to see at first how this sort of tuition can be given on the present scale of fees, but in the future the schools which devote a large part of their attention to teaching the rules of the road and its customs and courtesies will assuredly turn out the best class of drivers, who will be in the greatest demand.

The habits of horse drawn vehicles should be studied. It is a liberal education to make a journey, for instance, on the top of a Fifth Avenue motor bus and watch the way in which the driver takes his unwieldy vehicle through the streets of New York. Other bus drivers also are rapidly becoming his equal and let it be acknowledged that nothing but the hard school of practical everyday experience in the New York City streets, assisted by police supervision and the fear of dismissal for carelessness or accident, could produce such able drivers.

Again, the expert taxicab driver might be taken as an example of a faster class of motor traffic. The would-be first-class motorman when being trained would thus have the experience of horse vehicles and pedestrians, and have noted carefully what usually happens and have tried to understand their point of view. This is one of the first steps which should be taken in training the driver of the swift mechanical vehicle. Then example might be given of the proper way to drive cars around corners, both right-handed and lefthanded, and the best manner of attacking and surmounting steep gradients or negotiating high bridges. Driving at night should also be practiced and prospective drivers should learn to distinguish the faint glow on the road ahead which designates the presence of a motorcycle and other signs denoting persons or vehicles. Map reading should also be a part of his instruction.

And there is yet one other thing which the motor driving school should inculcate, though it could not technically teach the motorman, that is, good manners to his employer and his employer's friends. To be rough and rude is a disgrace to any class and it is the mark of a man who is either not certain of himself or is afflicted with an innate bad temper. It is not, and never can be, a sign of superiority. A respectful and civil attitude not only makes the path of life easier, but is in itself a strong recommendation. Little things which do not at first seem to matter, and are merely more in the nature of courtesy than servile attentions, should be observed. A civil salute when the owner first addresses the motorman, the readiness to help in any little matter, such as carrying a bag to the station, or the thought of a rug to cover the lap and similar little courtesies are the sign of the man who, if considerate in these little matters, is likely to be considerate in others more important. It also establishes him firmly in the estimation of his employer.

To sum up, the perfect motorman, though he should possess as much knowledge of mechanics as possible, should, above all, be a considerate driver, well versed in the manners and courtesies of the road and the habits of traffic. And in addition, he should try to be well-mannered, as more and more car owners are becoming convinced that, besides knowledge, "Manners make the Motorman."

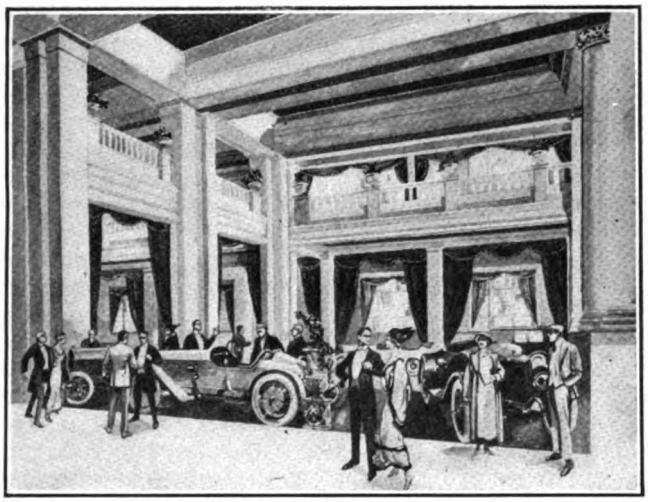
THE NEW YORK SHOW.

It Will Be Bigger and Better This Year Than Ever Before.

The Grand Central Palace has been forced to yield its last inch of space to accommodate the sixteenth national automobile show which is to be held there during the week of December 31 to January 8, under the auspices of the National Automobile Chamber of Commerce.

For several years past the demand for exhibition space has increased and this year the pressure was even greater than ever before. Despite this fact Manager S. A. Miles was able to allot space satisfactorily to each exhibitor.

In every way will the forthcoming show be bigger and better than any of its predecessors. It is an uncontrovertible and well known fact that manufacturers who display their products at the national shows are the representative makers of cars and accessories of this country and their goods can be relied upon. In all there will be 69 exhibits of cars and 215 exhibits of accessories at the Grand Central Palace show.



The show will be replete with new ideas in mechanical construction and body designs, for never before in the history of the automobile has mechanical progress been so great, and never before have body designs been so varied. With a number of makers building twelve and eight cylinder cars and others offering improvements in sixes and fours the public

Digitized by Google

will have a great variety of types and designs to choose from.

The advent of the twelve cylinder car as a commercial proposition and at a reasonable price is no doubt a big event of the year and in addition to this the increasing number of eights listed for 1916 serves to emphasize the growing popularity and possibly the real merit of what may be termed the multi-cylinder type of motor. Both the four and six cylinder types of motors will be much in evidence and those who favor these types will find much to interest their mechanical minds.

Having passed through the days when the single cylinder developed into the double cylinder, and later became the familiar four-cylinder type, then increased to six, and more recently the eight and twelve cylinders; having been through the mill of various sorts of transmissions, several kinds of ignition, and numberless other vital things, the car of 1916 represents the most remarkable mechanical development in two decades. The best brains of the world are at the command of the buyer, and they produce for him such a structure as was not thought

Sectional View of Decorated Interior.

possible when the industry started. Splendid factories of which the majority are fitted with the best designed and most modern machinery ceaselessly grind out parts that for exactness, proportion and quality of material never have been seen before. They are built in such a way that they last much longer. The upkeep and repair expense is less to the buyer, so that he not only gets more for his money in the intial investment, but he is the one who gains in the matter of upkeep.

While it is true that the demand for steel, copper, iron and other materials to be made into munitions has raised the price of raw material and brought about conditions making it difficult for motor car manufacturers to secure delivery of the raw and partly machined material, nevertheless such remarkable strides have been made in other directions that this extra expense is more than compensated. In increasing their outputs and installing modern and labor-saving machinery in their factories, manufacturers have been able to produce better cars or better parts at lower cost, even though the cost of the raw product has come somewhat higher. The parts makers are able to deliver complete assemblies to makers of assembled cars far more expeditiously, much cheaper, and of better quality in many cases than heretofore. Never in the world's history has there been such a popularizing of a complicated structure as that which the automobile industry has given us, and never before has such a multitude of improvements been crowded into a few short years and even a few short months.

The setting for the cars, parts and accessories at each automobile show of recent years has evoked considerable comment among visitors. For this year's show an original setting, quite different from that of other years, has been conceived by Manager Miles who says that the interior of the building is to be the "Palace of Motoria." Motoria is the goddess who watches over the destinies of the automobile industry, and she has been visualized in statuary and has graced a number of automobile shows in the past.

The goddess is a shapely girl, standing aloft with hands outstretched upon a steering wheel, her flowing draperies blowing in the breezes. The Palace, to be dedicated to such a goddess, cannot be adorned too attractively. Hence considerable pains are being taken to make the "Palace of Motoria" just as it should be.

The only criticism of the automobile shows of recent years has been that there is always "too much to see." The same will be true this year, but there will be more to see that is new and interesting than ever before.

THE GARAGE BUSINESS.

Address of J. C. Thorpe Before a Convention of Ohio Garage Men.

We are engaged in an important part of a great industry. The automobile business stands third in point of the value of manufactured products in the United States. It has developed in the short period of fifteen years from an infant in swaddling clothes, with a questionable future, to a fullgrown business, full of life and attractiveness. There are five million people, one-twentieth of our country's population, directly dependent upon the motor car and allied interests. Nearly 50 per cent. of the output of our machine tool works, in which we all have great pride, is absorbed by the automobile industry.

There are registered now in the United States something over two million motor drawn vehicles. Very roughly speaking, if we assume that there are five people who are served by each one of these vehicles, one-tenth of the population of the United States is directly interested in the automobile. Doesn't it appear that the economic administration of the affairs of such a business as this needs the most careful business methods in vogue in other lines of business? It seems to me there is no room for reasonable doubt in that respect.

I wonder if we can have a proper pride in our own part of this business, however large or small it may be, if we have to tolerate conditions which justify at least in a measure the term "the automobile game." Have you ever searched your own mind for evidence of your guilt when you hear some man say, as we often do hear, that the garage man is a thief and a robber and the automobile dealers a bunch of crooks?

Business Responsibility.

Listen. There is just one reason for the present unsatisfactory conditions in our part of the automo-

Digitized by Google

bile business, and that is that the men interested in the garage business, as well as the automobile dealers, have not lived up to their responsibility as citizens in the business world. Now then we have not given enough of our time, of our brains and of our energies to promoting a state of good health in this business. We have all been too selfish to see that the efforts we may put forth from time to time to benefit the other fellow will eventually benefit us. There has been an entire absence of the spirit of co-operation among competitors that characterizes every other successful business in this country.

I doubt whether there is any business you or I could mention that is marked by such economic loss and waste as is the part that the garage man and the automobile dealer has in the automobile business. I maintain that it is up to us to provide a solution for the problems presented. That solution must be fair to the public, to our customers, to our competitors and to ourselves. There is just one answer and that is the co-operation among competitors. It is true in every other line of business. It must be true in ours.

We must realize that by organization we can accomplish more and place our business on a higher and more dignified plane than by any other means whatever.

A Bit Ashamed.

You know I like to think about this particular thing—the dignity of our business. Every single man of you, as well as myself, engaged in the retail end of the automobile business and the public garage business, has an opportunity for public service thot does not come to every merchant, and, you know, as I look back over my experience in the automobile business, I even feel a little bit ashamed of myself that I will sit around and listen to complaints that are entirely unjust and listen to criticism of the garage business in general which you and I know is not true and sort of apologize for our business itself. It is all dead wrong, and I will tell you, fellows, the more we can stiffen up our backbone the more we can see our opportunities for public service and the more we appreciate the importance of organization in our business the sooner you and I will come to the point where we have a pleasant and profitable business.

Legitimate Prices.

There are here, I doubt not, men who have had previous experience in trade association organization of some sort. If you have discussed with your neighboring competitor the advisability of organizing a trade association, what has been the first plank you are going to nail down in the platform of that organization? Price maintenance.

In the beginning of association work you forget all the other things that are really of greater importance, because that price proposition will solve itself as sure as can be. But isn't it true that that particular thing, the question of price maintenance, has inspired more discussion in automobile trade associations than any other one thing. That too is all wrong, because of two factors. In the first place, a legitimate profit is necessary for permanence in any business. We won't disagree about that, will we? Therefore, the man who makes a practice of cutting prices is just following out a steady course that will result in his elimination from the business he is engaged in, so we don't have to worry about that.

The other important factor is there isn't one single fellow who has red blood and got any real stuff in him but what resents the attempt of any business man or bunch of business men to dictate to him what he shall do with respect to selling the stuff he buys and has for sale. I maintain that problem will solve itself and it ought to be put in the background as far as trade associations are concerned, and if the proper course of education is pursued, upon a good sound policy, the time is going to come and make money fast for the man who has kept his prices so he can make a living for himself. The men that keep their prices up are making money and are a credit to the business in the greater interest of good business.

Get Them All In.

Every man in your community who is legitimately engaged in the automobile business, whether giving away stuff or selling it at a proper price, ought to be a member of the trade association, and by that statement I can see from the expression on your faces I am laying myself open to a lot of criticism, but you will agree with me if you look the thing squarely in the face and see what the results are going to be. The solution of nearly all the problems that are presented in our business depends upon a carefully thought out educational policy. You have got to show the man what the advantages of organization are; you have got to show him what the evils of price cutting are; not, "if you don't do certain things we are going to kick you out or boycott your business," which is going to result in your home town having all of these men, or supposed men, in the automobile business.

In promoting the trade association work, there are a lot of problems that are presented that you have all thought about. There is the curbstone dealer, the sort of an agent of the factory that comes into a locality or town and comes in and sells a car in a ward or voting precinct and goes to the next ward and next precinct and makes another sale. There is the insurance man and real estate man who does not have the price of a car and wants to buy an automobile at dealers' rates and represents himself as a candidate for an agency and buys a car at dealers' prices. There is the banker that goes to the factory and represents himself to be the most influential man in his community and if they will sell him a car at the dealers' discount he knows where he can sell half a dozen more. All those things you and I face every day. The solution of every single problem lies in this one great big word "organization," and paradoxical as it may seem, co-operation among competitors.

The Curbstone Dealer.

Now, I want to ask you this question. Those men of you who are selling automobiles know pretty well the character of the men of the sales organization of your factory. Suppose a strong representative bunch of men in the State of Ohio get together and agree to form a State automobile trade association. You won't find business men administering the affairs of a factory who will disregard the protest of Ohio State Garage Owners' Association and won't submit to them with respect to their policy in selling cars. The factory is in the business as a permanent thing. They are not going to jeopardize their chances for future business by neglecting a protest from the Ohio State Automobile Association. Will that help to cure the curbstone proposition? The

Digitized by Google

reason there has been nothing done before is because there has been no organization.

Now, what about credits and collections? I have repeatedly had men in our place of business, driving through say from New York to California, and just outside of town they blow out a tire, and it is the second one they have had that day and they have no other and they don't want to spend their spare change to buy a tire because of the possibility of future demands made upon it. What are you going to do about that man's check?

Local Organization.

I know of one local association where this system is in effect: Mr. Dead-Beat comes along and runs a car into a garage and his bill amounts to $272—a good deal of money—and he drives his car out and by reason of good argument he has his account put on the books. He can't make a settlement where his overhauling was done and he has to have something else done, and he runs into another garage and has $15 worth of work done and has that put on the books, and keeps that up until he owes all the garages. Then he starts out by paying $10 to the fellow he owes $272 to and gets $15 worth more of work done. I bet there isn't a man in this meeting who hasn't seen this thing worked out in that way. In this association I am thinking of right now, the secretary has arranged a report of the men whose account is sixty days old, where settlement is not made and where it is impossible to collect the amount of the bill. All right. The car appears in another garage and the fellow knows he isn't going to get his money and will have to put the account on the book, and he calls up the secretary of the association and the secretary reports he is 60 days behind in his account at another garage. "All right," the garage man says, "Mr. Dead-Beat, you go over to the garage around the corner and pay your bill and then run your car in my shop and I will do your work for you and be mighty glad to do it." The possible economy in a local credit business is unlimited in that respect. The question of credit and collection can be handled in a local trade association with the greatest of satisfaction.

Legislation.

What about this great subject of legislation? Our good brother, the mayor, this morning hit upon a subject that is mighty near to most of us—the garage lien law. There is nothing about a garage lien law that is not legitimate. There is no reason why the garage man operating a repair shop should not be protected as any other man who does a similar service. I wonder how many of you would be willing to spend $5 a year per capita dues, if there could be passed a garage lien law; then after that bill was 60 days old you could reach out and hold them for 60 days, and, if necessary, sell it for the bill? Would you spend the $5?

What about the federal tax? I have in my pocket a letter that just came in yesterday's mail. From what I can learn Indianapolis is asking me to submit data in respect to our local business, which can be used by the National Automobile Chamber of Commerce in fighting the movement to place a dollar a horsepower tax by the Federal Government on automobiles. Is it worth while for us to take notice of the possibilities of organization that can fight that, or is it better for about three men in the State of Ohio to write letters to their representatives and ask them to fight that bill?

Time for Announcing Cars.

How many of the men here this morning sell automobiles? (Nearly every hand went up.) You men who are selling automobiles will appreciate this particular thing. Can you conceive of a more ridiculous situation than this: One factory announced a 1916 car in May and sold its output in October, 1915? Is there anything more foolish than for us to get out a set of circular letters to our customers, calling their attention to the fact that there is to be a national automobile show and make a bluff of going to Chicago to see automobiles that we have been selling for eight months? Is there anything that brings about a greater financial loss and greater conflict among the buyers as well as the sellers of automobiles than the fact that during the months of the year when nobody is buying cars the factories are insisting the dealers take shipments of cars and borrow the money to finance that question, store the cars in their garages when they could just as well get $6 or $8 a month storage for that space? Is there anything more ridiculous than that? Next May, June and July when he wants cars he hasn't anything to sell. Production is at the point of minimum sales. There is absolutely nothing in the world to justify it.

I think, perhaps, we all realize the reason for present conditions, brought about by some concerns who thought that by announcing a model six months in advance they could get a lot of business. We must admit they got away with it, because a man would say: "I am not going to buy your 1911 car when I can get a 1912 car instead, which is a year ahead," and they got away with a large amount of business and compelled even the substantial builders of automobiles to follow them in that respect, until at the present time we face the most chaotic condition in the merchandising of automobiles. There is no other business in the world that is characterized by such conditions as that.

Storage Rates.

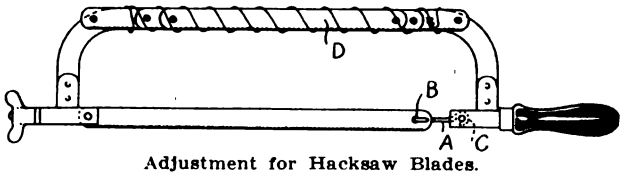
These things are in rather irregular order perhaps, but there is the question of rate equalization for garages. In Urbana and Champaign, Ill., you can store your car during the winter for from $2.50 a month up to $8.50. The man who gets $2.50 thinks he is making easy money and forgets it costs him $3 to have that car in there. I submit that the public is fair enough in their consideration of payments affecting the automboile business, if we are fair on our side. Is there any objection to the organization of a body of men in any community to solve such problems as storage rates, to cut the cost of mechanic's labor to the point of being a profit without robbing the public? When a man comes in we can show him just exactly how many hours have been put on that car if he asks to have his bills presented. There isn't any one fellow that can possibly solve all those problems.

Used Cars.

Then there comes up the question of the proper allowances on used cars. I don't know how many of you men have seen the recent issue of the report of used car prices, but there is at present a very strong movement on foot to solve the used car problem. In our local association it has resulted in a great deal of benefit because the fellows are beginning to realize and appreciate that you cannot do but one thing and that is make a reasonable allow-

Digitized by Google

ance upon any used car which will give you a margin of profit and pay you for overhauling the old car. This trade report, which you all should see if you haven't, has been a substantial guide for all trades that have been made in the last six months at least in our community.



Freight Rates.

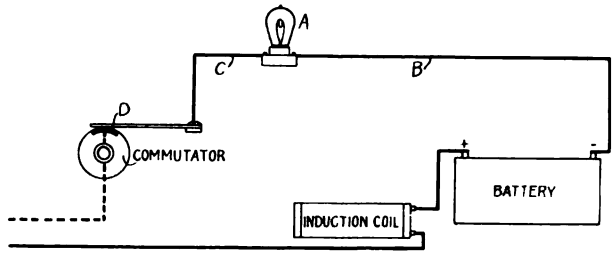
I wonder how many of us know that we are paying proper and equalized transportation charges on the stuff that we are getting. I wonder if we are all dead sure that the material that is being shipped to us from the automobile factory, etc., is properly classified and we are paying the lowest possible freight rates. I have know recently of some surprising benefits that have been secured by the study of freight classification and conferences between automobile men and freight agents. A protest which comes from an organized body of men to change classifications will be listened to and has been listened to in the experience of the last year or so, that I have known of.

How many of you men who raised your hands a while ago indicating that you are selling cars know just exactly what you are going to do if a customer comes and tells you that you are not doing as you agreed to before you sold his car? The interchange of ideas affecting the service warranted, and the adopting of a standard of service warranted, within the association, is a thing I hope to see accomplished.

Hacksaw Blades.

Hacksaw blades come in sizes from 6 to 12 inches inclusive and if one possess an adjustable frame,

Adjustment for Hacksaw Blades.



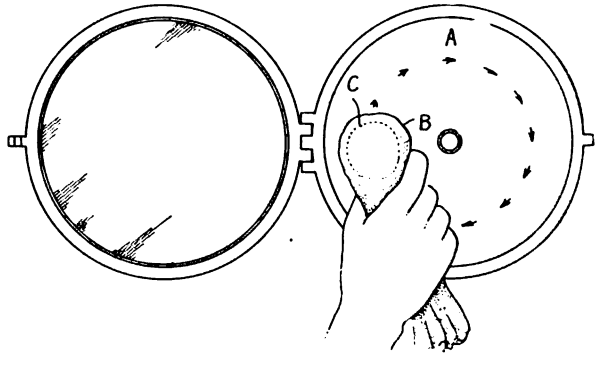
various sizes can be utilized. If, however, you find you have an 8-inch blade and a 10-inch non-adjustable frame, and cannot obtain the proper size blade, the suggestion shown in the accompanying illustration will be of service. It consists of taking a piece of stiff wire, A, that will pass through the eye, B, of the blade and bending the wire into a hook shape as shown at C. One end is bent at right angles to the other. Insert the hook in the eye of the blade and eye of the handle of the frame and tighten in the usual manner. If one carries a hacksaw in his tool kit, extra blades, D, can be easily carried by wiring them to the top of the saw frame as illustrated.

The Oakland Oiling System.

From C. T. B. Nevius, New Jersey.—I notice your inquiry No. 1708. I own an Oakland 42, 1913, and have had the same trouble as friend Davis. If his oiling system is the same as mine he will find the trouble at the sight oil dropper, which shows the oil dropping before it goes to the engine. If he will loosen the pipe that leads to the dropper (the dropper is located in my car just to the right of the carburetor under the hood) and then unscrew the top of the dropper he will find a small needle hole where the oil drops through. This hole becomes stopped with lint, etc., and completely stops the flow of oil and fills up the sight feed on the instrument board. A number of times I have found my dropper clogged so that I could hardly work the lint out.

Wire Testing.

From C. H. Kenyon, Connecticut.—In relation to your wire testing diagram from commutator to the battery. I am not looking for an argument, but the drawing given in your October issue would be mis-



leading to a beginner. The enclosed sketch, would, I think, be plainer and would enable the lamp A to light.

Cleaning Lamps.

Much of the efficiency of the electric or parabola lamp depends upon the cleanliness of the reflectors. As a rule the reflectors are silver plated and highly polished. They require different treatment from the gas headlights as the latter are of glass and are not as easily scratched. If the electric headlight becomes dirty, do not wipe it, but employ a stream of cold water to displace the dust or dirt and permit the surface to dry by the air.

If the reflectors, A, becomes dull after continued service they can be partially restored by using a soft chamois, B, with red rouge or crocus. This material should be used sparingly, and the chamois must be soft as well as free from wrinkles. Place a wad of cotton, C, about the size of an egg within the chamois. This will afford a smooth surface for wiping.

When properly used crocus will not scratch the silver plate. Moisten the chamois with alcohol, then apply the crocus to the chamois. Press very lightly

Cleaning the Reflectors.

and wipe with a rotary motion as shown by the arrows in the accompanying sketch. The object of employing a rotary motion is to prevent polishing marks.

The commencement of ignition should be as near the center of the mass of vapor in the combustion chamber as possible. To secure this use as long spark plugs as possible without coming in contact with the top of the piston.

NEW AND INTERESTING THINGS IN MOTORDOM

Speedometer Parts for Repair Shops.

Many jobbers, dealers and repair shop proprietors who read this publication are likely to be interested in the line of speedometer parts which is manufactured by the Ogden Manufacturing Co., Columbus, Ind. Their line includes speedometer parts, swivel joints, flexible shafts and fibre gears for every speedometer on the market. Their goods are of superior quality, and the prices are low. Readers are urged to correspond with this company if needing goods of this description.

Description of Model "T" Magneto.

The Model "T" Magneto is the latest development in ignition by The K-W Ignition Company, Cleveland. This magneto is of the true high tension type and is being built in 2, 3, 4, 6, 8, 10 and 12 cylinder models, and in each case, only one distributor plate is used. The 2, 4 and 8 cylinder models operate at engine speed; the 3, 6 and 12 cylinder at one and one-half times engine speed, and the 10 cylinder at one and one-fourth times engine speed. This is made possible by the construction of all K-W Tension Magnetos, which furnish four sparks per revolution. The circuit breaker is unusually fast and tests have been made up to 18,000 sparks per minute without missing, which is equivalent to operating a 12 cylinder, 4 cycle motor at 3,000 R. P. M.

The construction is up to the well known K-W standard in both material and workmanship and the same guarantee applies on the Model "T" as on all other models. The Model "T" Magneto has been designed so as to conform with all standard dimensions and has been made as nearly waterproof as it is possible to make a high tension magneto. The well known K-W inductor principle is used in this model, which with stationary windings and revolving rotor allows a spark of great intensity at as low a speed as 60 R. P. M., besides the advantage of no moving wires, connections or commutator. This model will be furnished also equipped with an Impulse Starter to aid in starting slow moving engines, which cannot be thrown over compression easily. The Impulse Starter mechanism holds the rotor in a stationary position until the firing point is reached, and when released is driven ahead with a rush, furnishing as hot a spark as though the engine was running full speed, and is automatically tripped out at any speed from 50 to 250 R. P. M.

The Auburn Six.

This is a six-cylinder car of very high quality, which is offered to the public at the low retail price of $1,050. The specifications of this car, which is known as the Model 6-38, are as follows: Six cylinder; 3x5 cantilever springs; electric lighted and started; spacious tonneau and driving compartment; 34x4 tires; 120-inch wheel base; completely equipped; made in three and five passenger models. For those wanting a somewhat more luxurious car, the same company makes the Model 6-40A which retails for $1,375. This is a six cylinder; 3½x5; cantilever springs; electric lighted and started; luxuriously roomy tonneau and driving compartment; folding auxiliary seats; 35x4½ tires; completely equipped; two and seven passenger models. The same company also makes a four cylinder car, Model 4-38, which retails for only $985, although the specifications are in many respects similar to the higher priced cars. For catalog and full particulars write to the Auburn Automobile Co., Auburn, Ind.

An Automobile Record Book.

It is a very important thing for every car owner to keep a record of purchases, repair bills, gasoline bills, tire repairs and other expenses connected with the running of his car; also to keep a record of mileage and the various trips made. An excellent book for keeping such a record is The Universal Automobile Record Book, and a sample of this book will be sent for 25c post paid by the originator of it, Eugene Mathews, Clifton Forge, Va., and no doubt many of our readers will wish to obtain a sample copy on such favorable terms.

New Enterprise at Joliet.

W. O. Dayton, chief engineer of the New Era Engineering Co., of Joliet, Ill., has resigned his position and has organized a company for the manufacture of light automobile chassis and light worm axles for domestic and export trade.

Premier Automatic Electric Vulcanizer.

With the Premier Vulcanizer the electric circuit is automatically opened by a thermostatic cut-out, which is just as positive in operation as a thermometer or any of the best controlled fire sprinkling devices now on the market, which all depend upon the alloy fusable at a certain temperature, reaching the melting point.

With this patented automatic temperature control, it is impossible to overcure or burn the repair, as the electric current is automatically cut off entirely the very instant the vulcanizer attains the correct amount of heat to properly vulcanize the repair.

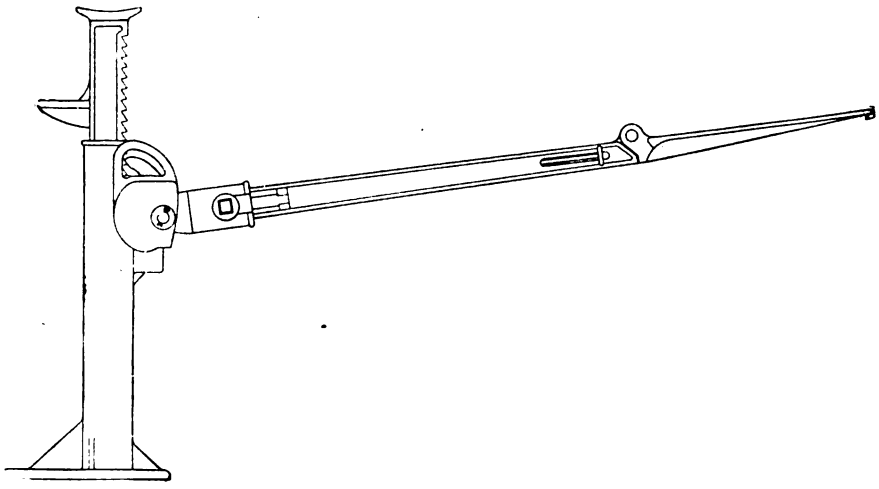
The Premier is very simple in operation and a great time saver. After the tube or casing is prepared and the device clamped on, the button is pressed and then the operator is free to work on another job as when the repair is completed the electric current is automatically cut off and the vulcanizer cools off.

The Premier is small and compact and as it weighs approximately two pounds, it is not a burden to carry in the tool compartment but is always ready to put a patch on an inner tube and to heal cuts in casings while new, which means much toward saving blowouts and cutting down tire expense. The Premier Automatic Electric Vulcanizer is also furnished with approved type connecting cords and connectors and a separate base for holding the vulcanizer when not in use. This model has been approved by the National Board of Underwriters and sells complete for $5. Its great advantage is the fact that it reduces the fire risk for garages and shops in which it is used.

Johnson's Cleaner and Prepared Wax.

So that our readers may be made familiar with the appearance of the packages, we show herewith a correct representation of a can of Johnson's Prepared Wax, also of a can of Johnson's Cleaner for automobiles. These articles have been extensively advertised, and they are of such merit that enormous sales have been secured on them throughout the United States. While Johnson's Prepared Wax may be already familiar to our readers, Johnson's Cleaner is a comparatively new article. It is a motor car cleaner that cleans, just as Johnson's Prepared Wax is an automobile polish that really polishes with least effort and permanent results. Johnson's Cleaner quickly removes spots, stains, scum and surface scratches that ordinary soap and water will not touch, and Johnson's Prepared Wax "sheds water like a duck's back," and makes a wash last four weeks, and is guaranteed not to gather the dust. The manufacturers offer to send a sample can of Johnson's Cleaner

if you will use the coupon attached to their advertisement and send them ten cents, or if you will send twenty cents for combination outfit they will send you one sample can each of Johnson's Cleaner and of Johnson's Prepared Wax, but it is necessary to use the coupon attached to their advertisement, so that they can identify the source of the inquiry for samples. Address all communications or inquiries direct to S. C. Johnson & Son, Racine, Wis.



Test Your Electric Apparatus.

The Wheatstone bridge will do it, and James F. Hobart of 1702 Lockwood Street, Indianapolis, Ind., will send, for $3, drawings and instructions for making one.

Digitized by Google

Hartford Auto Jack.

The Hartford Auto Jack is regularly specified on a number of high-grade cars as stock, factory equipment. Its great power and ease of manipulation, under the heaviest loads, is due to the gear combination employed. The manipulation of the handle operates by means of a ratchet, a pinion meshing with a large gear, the movement of the latter being directly communicated to a pinion engaging the rack on the moving upright. The entire mechanism is wholly enclosed in metal castings highly finished in black enamel. The bearings throughout are of generous size, carefully fitted, and freely lubricated by grease held within the casing. A trip is provided by means of which the action of the ratchet is reversed, so that the load can be either lifted or lowered by the same movement of the handle. The Hartford Jack is

Powerful and Quick Acting.

finely finished in black enamel, and is packed in a stout canvas bag, so that it will not be marred in the tool-box. It is listed at $6.50. This Jack is manufactured by the Hartford Suspension, 143 Morgan Street, Jersey City, N. J.

Ahlberg Bearing Company.

Announcement comes of the opening of the Minneapolis branch of the Ahlberg Bearing Company; the new store being located at 936 Marquette Avenue. Mr. W. C. Bender, sales manager, who just returned from the twin cities, states that the northwestern territory will be handled from this new branch in charge of Mr. L. J. Bohan.

The Ahlberg Bearing Company of Chicago during the past nine years has consistently enlarged its organization and scope, now having branches in New York, Boston, Detroit, Cleveland, St. Louis, Los Angeles and Minneapolis.

It is possible for the customer to receive immediate service at any of these branches where he may obtain for his worn out bearings a reground bearing of any type or make, guaranteed equal to new, paying about one-fifth of the price of a new bearing.

The Brown Spring Oiler.

The Brown System of spring oiling should interest every car owner, dealer and repairmen. Dealers who will act as agents for the Brown System will be backed up by extensive advertising, and if you undertake the sale of this specialty, the manufacturers will advertise you as the Brown System Man. This system is entirely automatic. No spreading of leaves is necessary, no jacking up the car, no tools are needed and no hard work. Lubricating the springs by this system removes rust, takes out squeaks, makes the care ride easy, and lessens spring breakage. The Brown System will be exhibted at the New York Automobile Show in Space D 106-107, and in the Chicago Automobile Show in 98 Coliseum Gallery. For full particulars write direct to the Brown Spring Oiler Co., 6525 Carnegie Avenue, Cleveland, Ohio.

Invitation to Visiting Dealers.

There will be a large number of dealers in New York city during the annual Automobile Show, and the Times Square Auto Co., whose warerooms are located at the southwest corner of 56th Street and Broadway, has issued an urgent invitation to these dealers to visit their store while they are in the metropolis. This house is a very large one, and carries an absolutely complete line of automobile accessories. Within thirteen years of their business history they have been obliged to move five times to larger Broadway quarters, and they are now located in a plant having over 200,000 square feet of floor space, with an institution almost equally as large on Michigan Avenue, Chicago. They have also opened up a new branch recently at Kansas City, Mo., where they will take care of their large southwestern trade. Everything imaginable in the auto accessory line is carried in stock by this house and a visit to their warerooms will be found extremely interesting.

Limousine Tops for Ford Cars.

Many of our readers who are owners of Ford cars will be interested in the announcement made by the Wadsworth Manufacturing Co., of Detroit, Mich., in regard to their Wadsworth all-season limousine for Ford cars. This top will make a Ford car warm and snug in the winter, and it is also cool and comfortable for summer use. It fits flush to the body of the car with no overhang, and there is positively no rattle or squeak. It is finished of the same material which is used in upholstering the car. The glass doors and panels are easily removed if desired, and a set of curtains used in their place. Get full details from your dealer or, better still, write direct to the manufacturers for an illustrated catalog. The same top is manufactured for application to Cadillac, Studebaker, Overland, Reo, Dodge, Maxwell, Buick, Hudson and Chalmers cars. Be sure to address all inquiries to the Wadsworth Manufacturing Co., 1308 Jefferson Avenue, Detroit, Mich.

An Oil That Flows Freely at Zero.

Car owners who intend to drive their cars throughout the winter will be intensely interested in the advertisement which appears in this issue from the Gulf Refining Company, of Pittsburgh, Pa. They call attention to the fact that the Supreme Auto Oil, which is a product of their refinery, flows freely at zero, which is a feature of great importance. It is the custom of many car owners to shift from a heavier oil to a lighter oil in the winter, but there is an element of risk in doing this, as a great many of the light motor oils thin out to such an extent from engine heat that they are no better lubricants than kerosene, but Supreme Auto Oil is guaranteed to give sufficient lubrication, and it contains no paraffine to thicken under low temperatures. Write for free booklet containing illustrated charts of Engine Details, Tire and Gasoline Records, and hints on lubricating, and address all inquiries for this valuable booklet to the Gulf Refining Company, Department 1880 Frick Annex, Pittsburgh, Pa.

Tuthill Titanic Springs.

These springs will be exhibited at the Chicago Show, second floor of the Coliseum Annex, Booths Nos. 156 and 157. They are guaranteed forever against center breakage. Dealers made a nice profit on spring replacements during the past season by handling these springs. Write for the name of the nearest Tuthill spring distributor who carries a stock of these springs, so that you can order in large or small quantities. Get full particulars from the Tuthill Spring Co., 758 Polk Street, Chicago, Ill.

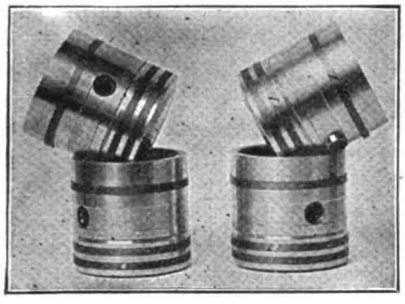
The Niswander Tire Rim Remover.

This tool does away with all troubles in changing rims on your automobile tires. With it a tire rim can be changed in two minutes. It expands the rim as well as contracts it, and the spring hooks are so arranged that the harder the pull, the tighter they grip the rim in either operation. This tool can be purchased from any dealer at $3, but if your dealer does not have them, the appliance may be obtained by prepaid parcel post if you will send $3 to the Niswander Manufacturing Co., Quincy, Ill.

Detroit Batteries for Dealers.

It will surprise many of our readers to learn that there are more than one million batteries sold at retail each year in this country to automobile owners, and the dealer who does not sell batteries is losing a very important item of trade. One great advantage in handling the Detroit batteries is that they are made for every car, and every make of starter on the entire list, and these batteries are regular equipment on Argo, Crow, Mecca, Moore, Monitor, Niagara, Princess, Denby Truck, Disco Ford Starters, and many others. The manufacturers have an extraordinary proposition to make to every live dealer in the United States. Early requests for terri-

Digitized by Google



tory will be given the preference. Write at once for full particulars to the Detroit Battery Co., Detroit, Mich.

Halladay Bumpers and Flexlevers for Ford Cars.

The line of bumpers made by the L. P. Halladay Company of Streator, Ill., is an unusually complete one. They make several different styles, fitting all the standard makes of cars. These bumpers will stand the most severe shock and they are made of specially heat treated stock. The bars can be straightened if bent, and they are handsomely finished in black japan, polished brass, or buffed nickel plate. The same company makes the Celebrated Flexlevers for Ford cars, which may be attached to the front or rear wheels of the Ford car or both. It is said that these Flexlevers will make a Ford car ride as easy as most luxurious and expensive cars. They can be attached in 30 minutes without removing the wheels and they are sold on 30 days trial, and guaranteed for the life of the car. In writing to the L. P. Halladay Company at Streator, Ill., address, Dept. D, and ask for catalog and circulars.

Special Alloy Pistons.

Butler's Special Alloy Pistons weigh about 35% that of the cast iron piston. This reduction in weight automatically reduces the inertia force about 65%. A further reduction can be made by lightening the weight of the piston pin

Butler Pistons.

and connection rod in proportion to the reduced load carried, making a total reduction in inertia force of approximately 75%. With this great reduction of vibratory forces, we find in fitting about 60 different make motors, the average four cylinder motor ran very quiet and with little vibration, had more power, better get away and developed less trouble. The riding qualities were greatly improved. Owing to the high thermal conductivity of our alloy, practically fourteen that of cast iron, carbon deposits are small and valves do not require grinding as often. Our pistons are moulded in metal chill on special chilled soft sand core, which allows the core to crush in cooling of the casting. By this method we gain in malleability, hardness and strength, and eliminate the "growing" of pistons in use, as the outside of the piston is denser than the inside surface. It requires more metal and labor to make this style piston, than by the die cast process. After months of actual road tests we have found this type of piston to give the best all around results. The difficulties experienced with piston side slap and the pumping of oil has been eliminated by special design for average speed up to 50 miles per hour. We find it impossible to make a motor free from piston slap in running slowly and having sufficient clearance for extreme high speeds. In points of economy we find the aluminum alloy piston in every test has given more miles per gallon of gasoline and oil. Also the extra clearance is an advantage in cranking a cold motor for it requires less power.

A Scientific Oil Packing Piston Ring.

There are so many good piston rings on the market that this subject is a rather confusing one to many buyers, but we desire to call special attention to the No-Leak-O Scientific Oil Packing Piston Ring for which the manufacturers claim the following advantages. The rings are concentric, giving an even tension and all around fit. The oil grooves afford perfect lubrication, giving less friction and long life to the ring. The grooves control the oil and carbon and oil troubles are eliminated. The surface of the center ring is unpolished and fits quickly to glassy hardness. The polished sides give a close fit with free movement. The skin of the casting is left on, giving permanent resiliency and a perfect fit. The manufacturers claim that with this piston ring the engine will generate more power, use less oil and less gasoline on account of the reduced friction, and repair bills will also be reduced. Write for folder, asking for special trial offer. Distributors are wanted, considerable good territory being still open. Address all inquiries to the Automobile Accessories Co., 816 West North Avenue, Baltimore, Md.

Townsend Grease Gun.

A good grease gun is an exceedingly handy article in any garage, and the Townsend Grease Gun, manufactured by S. P. Townsend & Co., Orange, N. J., is highly recommended. This gun can be taken apart and filled easily and conveniently, and it is also easy to keep clean, and is easy of operation. To use this grease gun it is only necessary to fill it with a steel paddle, which goes with the gun. Then slip the inner tube into the outer one, secure with the cap and turn the handle. You can load and shoot a pound of grease in a minute and not a particle will get on your hands or clothing. The advantages of such a device are too obvious to need comment, and it would probably be to your advantage to correspond direct with the manufacturers, who will be glad to furnish full information.

Parry Manufacturing Company to Make Trailers.

The Parry Manufacturing Company of Indianapolis, Ind., one of the largest carriage manufacturing plants in the world, which has devoted its immense factory to the production of horse-drawn vehicles for over a third of a century, has now announced the manufacture of automobile trailers, commercial bodies and tops, and the chief activities of the company in the line of commercial bodies will be directed toward designs for the Ford chassis, although the facilities of the plant are such that the company contemplates going after large contracts for commercial bodies to be used on other cars as well. The trailers which this company is building, comprise two models, a two-wheeler and a four-wheeler. One prominent feature of the Parry Trailer is the manner in which the connection is made. The hitch is a convenient adaptation of the Bradley Couplers and permits of a straight-pull on both ends of the axle which adapts itself to the motion of the rear axle of the car, making the most practical form of trailer attachment.

To Revolutionize Storage Battery Making.

Wright Rapid-Fire Storage Battery Co. of 96 Market Street, Poughkeepsie, N. Y., is making a storage battery that all manufacturers are striving to do but so far have been only partially successful. With the use of a special process in the making, this company has made it possible to give the consumer something at moderate cost that will give more power than many of the high priced batteries now in use. Some of the claims for this battery are, the plates do not sulphate, or buckle, it will yield a larger proportion of charging current than other batteries, plates have longer life on account of a special process in the making as shown by tests, retains its charge longer than other batteries, has a lower internal resistance proved by the high discharge rate, and most important of all, it has a discharge rate of more than double that of any other of like weight.

Crane's Patent Wheel and Gear Puller.

This is an extremely handy device in any repair shop or garage. It is a useful tool for removing auto wheels, fly wheels, transmission and shaft gears, commutators, sprockets, collars, couplings, etc., and it is made with a New Combination Hook and Extension Arms and Screw, with inserted Tempered Tool Steel Point. This device is fully guaranteed, and it is made in various shapes and sizes, adapted for different kinds of work. Write for circular "D" to the Crane Puller Company, 54 Lake Street, Arlington, Mass.

Starting, Lighting and Ignition for Ford Cars.

The Westinghouse Electric and Manufacturing Co. have commenced shipments of their starting, lighting and ignition equipments for Ford cars. For several months they have directed their efforts in designing and testing and manufacturing, and they now have a large stock from which to make immediate shipment. They announce that this system is free from the driving chain and sprocket troubles heretofore generally experienced. The perfected equipment includes a silent chain of double previous chain strength, special compensating sprockets and easily adjusted mounting brackets. We understand that this system will be exhibited at the New York and Chicago automobile shows. Address your inquiries to the Westinghouse Electric and Manufacturing Co. (Automobile Equipment Dept.), Shadyside Works, Pittsburgh, Pa., or information may be obtained from the branch agencies of this company which are listed in their advertisement in this issue of our magazine.

A New Easyon Chain.

The Leather Tire Goods Company of Niagara Falls, N. Y., announce that they are bringing out a new size of Easyon Chain especially for Fords and other small cars. They will be called size 3½ and will fit 3 or 3½ inch tires and sell at $2.60 per set of eight. The second size, called 4½, will fit 4 or 4½ inch tires and sell at $3.50 per set, and the larger size, called 5½, will fit 5 or 5½ inch

tires and sell at $4.50 per set. Each set is packed in a small bag suitable for carrying in a car. Easyon Chains fasten to the spokes with leather-covered fasteners having snaps at each end for holding and adjusting the cross chains. They can be applied in a moment and are absolutely needed so as to prevent any danger of getting stuck on the road.

Display for Dealers.

Easyon Chains will be sent on approval to any part of the United States or Canada on receipt of the above prices. We illustrate the chains as applied to the tire, also display stand furnished to dealers for showing these chains.

Welding and Cutting.

This work is published by the McGraw-Hill Book Company, 239 West 39th Street, New York, has 139 pages, numerous illustrations, and sells for $1. The author has been a teacher in the schools where the subject is treated in Germany and the book is written from this standpoint. But it is well done, on the whole. The range of welding technique is so wide that a thorough study of the process requires extensive research which makes great demands on the time of the reader. This book will be welcome to the works engineer, to the foreman, and to the practical autogenous welder. In it the most important elements of the process are placed together in an easily available manner, and it is a faithful companion and a reliable adviser in connection with the various questions arising in practice.

Springfield Body Company.

The demand of automobile buyers for the "Springfield" type of car is emphasized by the announcement that a new concern called the Springfield Body Company has been incorporated with a capitalization of $1,000,000 to take over the business of the Springfield Metal Body Company, of Springfield, Mass.

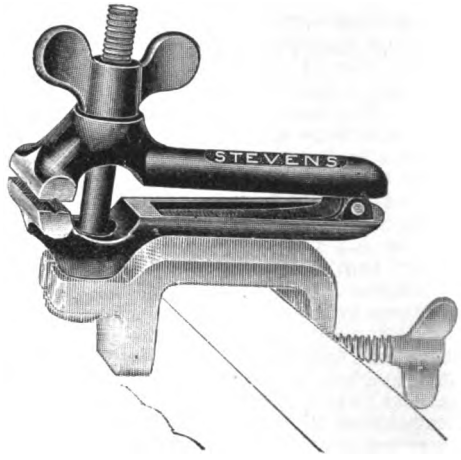
About a year ago W. L. Fry, president of the new corporation, became interested in the old company. At that time the general public was just beginning to realize that an enclosed car was a great luxury in the winter time and to grumble about the high price of limousine bodies. Manufacturers were quick to recognize this demand and all sorts of cheap, makeshift winter tops appeared on the market..

The convertible body made by this company is one of the most popular on the market and is being used by some of the biggest automobile concerns in the country. The Studebaker, Maxwell, Chandler, Mitchell and Paige-Detroit companies all furnish Springfield convertible bodies as regular equipment on their cars.

The Stalit Heating Plug.

This is an electrical device designed to make automobiling pleasant under all weather conditions, because it eliminates the disagreeable trouble of starting a cold motor. With this plug the hard work of cranking a cold engine becomes child's play, for it dispenses with the difficulty of priming the cylinders and tickling the carburetor. This is a friend in need to any winter motorist, and it is within the reach of all, as it sells for only $2.25. For circular with full particulars write to the manufacturers, Geo. Staats & Co., 252 Lorimer Street, Brooklyn, N. Y.

A Good Air Compressor for Repair Shops.



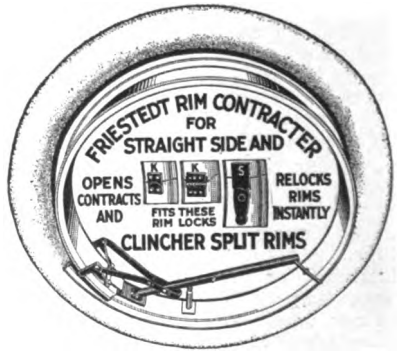
The Au-To Air Compressor is described by the manufacturers as a machine that puts the "air" in "repair shop." It furnishes air for every purpose from inflated tires to cleaning inaccessible parts of an engine, and the air can be provided at any pressure up to 300 pounds and in quantities as desired. This compressor is small in size and price, but large in capacity. It is all metal, air cooled, simple and practically fool-proof. It takes up very little floor space, is light in weight and is guaranteed to do the work required of it. For prices and full particulars write to the Au-To Compressor Co., Dept. 62, Wilmington, Ohio.

Hurry Orders a Specialty.

Repairmen who are in a hurry for anything in automobile forgings, hardware or trimmings should send their orders to John A. Gifford & Son, 25 Park Place, and 22 Murray Street, New York City. This is one of the oldest and most reliable houses in New York, having been engaged in the sale of vehicle hardware and trimmings for more than half a century. They carry a large stock of supplies of every description and make a specialty of filling large or small orders with the utmost promptness.

Stevens Hand Vise.

We illustrate an exceedingly useful hand device for repair men, and also to car owners who look after their own machines. One of the many emergencies in which the device saves time and annoyance is in the ease and convenience of replacing a bent or twisted locking ring on a Quick Demountable Rim. With the use of this hand vise one end of the ring can be clamped to the rim, allowing a quick setting in place of the entire

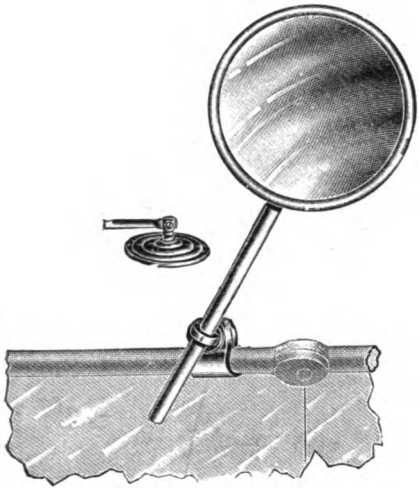


Vise in Use.

ring with very little effort, and, of course, there are many other uses for this vise in working around a car. It is strongly made of drop forged steel, 4 inches long over all, jaws hardened, 1⅛ inch wide, opening to 1¼ inch. The jaws are kept open by means of a C spring, housed in grooves within each side, and a wide wing nut allows an extra firm grip. The tool has a neatly lacquered finish, and it should be in the kit of every car owner and a great many of these vises can be used to advantage in garages.

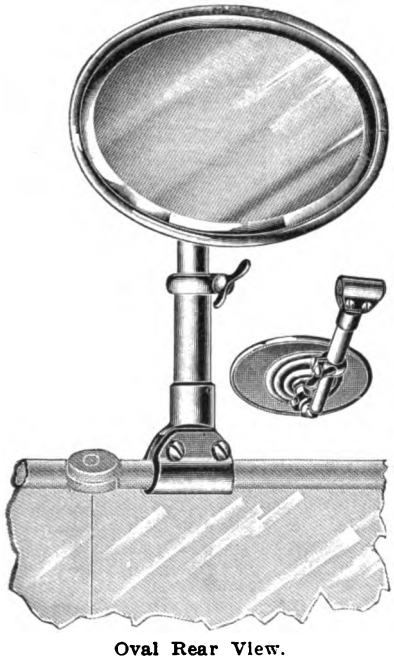
The Friestedt Rim Contractor.

This wonderful invention for quick tire changes is illustrated herewith. It makes changing the tire as easy by the roadside as it is in the garage. Anyone who has put on tires will understand how this tool works by studying the illustra-



tion. It opens, contracts and re-locks rims instantly and this rim contractor may be used on straight side and clincher split demountable rims instantly and without clamps to adjust nor bolts to tighten. It is a fast, powerful and effective tool which will save the motorist care, time, worry and profanity. This device will be exhibited in the New York Automobile Show in space D-8, fourth floor, and in the Chicago Automobile Show in space 9-B, Coliseum basement. Readers who are interested should write for prices and full particulars direct to the Friestedt Rim Contractor Co., 2934-2938 West Lake Street, Chicago, Ill.

Digitized by Google



Mirrors for Ford Cars.

We illustrate two types of rear view mirrors especially made for Ford cars. The round rear view mirror, as shown, is 4 inches in diameter, and is especially made for the Ford car. It contains a diminishing glass and is fitted with a high-grade lens, and the material and workmanship is excellent throughout.

Round Rear View.

This is designed to give the driver a perfect reduced view of all objects in the rear without turning the head, and it can be attached to the wind-shield or upright rod. It is small and neat, and an ornament as well as a necessity to any car. It can be furnished with all brass finish, or black, or all nickel, and the list price is $1.25. The oval rear view mirror, also illustrated herewith, is made in 5 by 7 size. It is of French

Oval Rear View.

plate glass, with beveled edges, highly polished and perfectly ground. It has a universal ball socket on the back of the frame which allows the mirror to be set at any angle, and it will remain stationary. It also has an extension handle moving in a radius of from 5 inches from the windshield to 12 inches from the windshield. The finish is of the highest grade, and this is an exceptionally fine mirror in every respect. Purchasers may have a choice of finish all nickel, all black, or black body and nickel rim, black body and brass rim, or all brass, and the list price is $3.50. Both these mirrors are manufactured by Bergman Bros., 1777 Broadway, New York City.

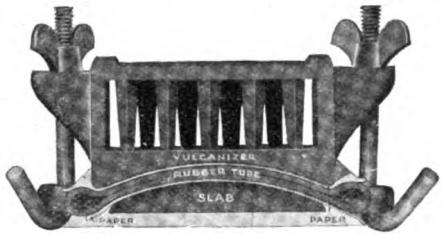
The Barefoot Tire.

This is a new safety tread tire which has recently been brought out by the B. F. Goodrich Co., Akron, Ohio. The peculiar and desirable features of this tire are fully described in our advertising columns this month, and the technical description is well worthy of the careful attention of all our readers, whether they are car owners, dealers, repair men or public garage owners. The Barefoot Tire is known by the new black tread, which gives a stylish appearance, and it is the result of many years of careful experiment in the effort to produce a tire with a clinging quality, which will give traction without friction, on the same general principle that it is so much easier to get your footing with bare feet than it would be with slippery shoes on the feet.

Cleveland Tops for Ford Cars.

A large variety of practical tops for the Ford car is manufactured by Cray Bros., 1119 West 11th Street, Cleveland, Ohio. This includes Cleveland Regular Tops for Ford touring cars, also the One-Man Top for Ford runabouts and the Cleveland Slip Roof Outfit "A." All of these various tops are described in a special announcement which appears this month in our advertising columns. Dealers should write direct to the manufacturers for their special dealers' proposition on tops and slip roof outfits for Ford cars, and all car owners, as well as dealers, repair men and garage owners should write for the 512-page catalog which is issued free to the trade by Cray Bros. This is a valuable reference book for any garage man.

Kant-Slip Products.



Two useful accessories are manufactured by Ford & Lyon, of Fitchburg, Mass. One of these is the "Kant-Slip" Inner Liner, which is one of the best on the market, as it can't slip inside of the casing. When this liner is placed inside of the tire, and the tire properly inflated, the liner will stay just where it is put and cannot slip. It is also a complete inside fabric reinforcement, extending the full length of the tire from bead to bead, and it is so durable that it can be re-used after the old casing has been discarded. The same firm manufactures the Kant-Slip Fan Belts for Ford cars. These are very popular with Ford owners, as they will give 100 per cent. service. They are absolutely guaranteed not to stretch and are oil-proof and made in endless belt style with no chance for defective seams. The cost of these belts is only 30 cents each. Readers who are interested in these two live accessories, whether they are dealers or owners, should write direct to the manufacturers for prices and full particulars.

Weehawken Tungsten Lamps.

Many garage owners and repairmen can largely increase their profits by carrying in stock a line of electric lamps for automobiles. The Weehawken Tungsten Lamp Co., Weehawken, N. J., manufactures a line of Tungsten Lamps which is likely to appeal to every car owner. This company is closing up territorial rights with jobbers now and it will undoubtedly be to the advantage of many of our subscribers to write immediately to them and secure the agency for these lamps, as they make a particularly attractive offer to dealers.

The Worcester Automatic Vulcanizer.

This is a small vulcanizer which enables the car owner to make his own tire repairs without recourse to garage or repair shops, and it will also do away with an extra wheel or shoe attached to the

For Tube.

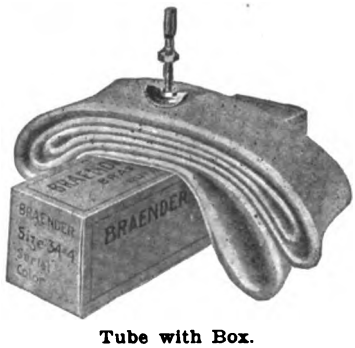
car. In fact, it means practically the end of tire troubles, as it enables the car owner to fix, while on the road or in the garage, any puncture or blow-out, from a pin-head to an ugly gash. The price is $3.50, with money back if not strictly as represented. Every machine is guaranteed, and this vulcanizer will make permanent repairs in inner tube or shoe that are lasting, cost little, and are safe, speedy and strong. Write to-day

For Casing.

to the manufacturers, the Worcester Manufacturing Co., Vine and Foundry Streets, Worcester, Mass.

Detroit Battery Co. Builds.

The Detroit Battery Co. of Detroit, Mich., has made arrangements for the erection of a new factory building which the growth of their business has made necessary. The building is to be 70 by 100, of reinforced concrete fireproof construction throughout, and thoroughly modern in every way, with provision for a welfare room, shower baths and other conveniences. Ground has been broken and the building will be ready for occupancy the first of the year. The new building will enable the company to triple their working force, and provision is made for the erection of three additional stories as the business warrants it.



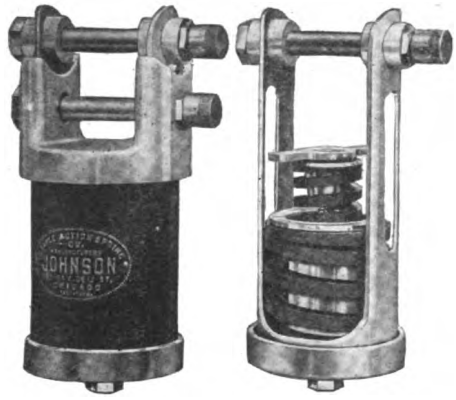
Digitized by Google

Two Good Winter Specialties.

We wish to call special attention to two very useful winter specialties for the car owner which are manufactured by the Interstate Electric Co., 1845 Perdido Street, New Orleans, La. One of these specialties is the well known Steer Warms, which is a device for keeping your hands warm while driving. It consists of two neat leather covered grips, electrically heated which lace on the steering wheel at any place convenient for driving. They are operated from the storage batteries (or magneto on Ford cars) and cost nothing to maintain. They are simple, easy to install, durable, and guaranteed for five years. The price of this device for standard gasoline cars is $7.50, or $11.00 in Canada, and the special Ford type sells for $5 in this country, and $7.25 in Canada. This is a winner for any dealer to handle, and many dealers who subscribe for this publication will no doubt be glad to correspond with the manufacturers and obtain territory for this fast selling winter specialty. Another accessory which is particularly adapted to the cold weather is the Ieco electric manifold plug made by the same company. This plug does away with all cranking and trouble in starting the car in zero weather, while if you have a self starter it saves using up all your battery in revolving the engine many times. This plug puts a hot vaporized mixture into the cylinders, and the engine goes at once. The price for all cars is $5 in this country, or $7.25 in Canada. Correspondence on both of these specialties from dealers, repairmen, garage owners and car owners is invited by the manufacturers.

Pure Gum Inner Tubes.

Automobile owners are demanding this type of tube, as they realize that the initial additional cost is offset by the better service they receive from pure gum inner tubes. The tube is extra heavy built, each packed in a neat carton and protected from chafing in the box. Pure gum inner tubes are made with all rubber with sufficient sulphur to cure them, and will outlast by far any composition



Tube with Box.

tube. The advantages are that the pure gum tube does not get out of shape as a composition tube does; can be repaired a greater number of times than a composition tube and will always retain its shape, and lasts about three times as long as a composition tube. It is by far the cheapest tube and the best tube for the automobile owner to buy. The tube is shown with box, as manufactured by The Braender Rubber & Tire Co., of Rutherford, N. J.

Subscribe to the "Automobile Dealer and Repairer," $1.00 Per Year.

The Triple Action Spring Company.

The manufacturers of the Johnson Shock Absorber, have come out with an improved 1916 model. They still maintain the same principle as in previous models. The changes are chiefly in the mechanical design, employing compression type springs in the outer, or heavy coils, instead of the inter coiled expansion type formerly used. By using a steel stirrup spring hanger for the outer coil, and a steel spring cup for the inner coil, the cup passing through the bottom of stirrup hanger as the tension increases, thus allowing a long free resilient action of both inner and outer coils, the inner coil being of lighter tension

New Shock Absorber.

than outer coil, giving a variable tension automatically. Also the rebound of the car is checked by the small inner coil. The top cap has been changed to a closed, weather proof design, with curved slots for the main stirrup hanger to pass through. At the bottom of the casing is an adjustment bolt; the nut on this bolt is self locking, making it possible for the non-expert to adjust the absorbers to any load or road conditions. Different sizes are made to apply on all cars from the lightest to the heaviest. Prices, $22.50 and $30 for all pleasure cars. $40 for trucks.

Harvey Boltless Auto Springs.

These springs are guaranteed against all defects. They are made of the finest selected steel. The plates are scientifically formed and tempered on the Harvey patented machines, which make them with an accuracy and uniformity that it is not possible to obtain with hand labor. Each step in the manufacture of Harvey springs is carefully watched, and every spring is inspected and tested before being shipped. These springs are made without a hole in the center. Instead of a bolt a small depression, or bead, is used to keep the plates from shifting. This preserves all the strength at the center, or point of greatest strain. Over 10,000 springs are carried in stock by the manufacturers at all times for quick shipment, and the Harvey springs are also carried in stock at all leading jobbing centers. Jobbers, dealers and garagemen are requested to send for an interesting free book, entitled "Automobile Springs," which gives a complete list of the springs required for over 300 of the leading makes and models of automobiles, also detailed measurements, specifications, and other valuable information that has never been published before. You should send for a copy of the Harvey Auto Spring Book today, and keep it for quick and ready reference. They will be mailed absolutely free for the asking. Address all inquiries to the Harvey Spring Co., 849 Seventeenth Street, Racine, Wis.

The Sta-Tite Piston Ring.

The manufacturers of this well known piston ring make the following claims for it: increase of motor power, prevention of lost compression, decreased fuel consumption, saving in oil, prevention of smoking, prevention of excessive carbon formations, remedy for flowing spark plugs. The Sta-Tite has sometimes been called the Eternally Tight Ring. Write for full information direct to the manufacturers, The Piston Ring Company, Specialists in Piston Rings, Muskegon, Mich.

Restoring Old Automobile Tops.

We wish to call the special attention of our readers to the "F-S" Evernew Auto-Top Dressing, which is manufactured by Felton, Sibley & Co., Inc., 136-140 N. Fourth Street, Philadelphia, Pa. This dressing will actually restore the life and looks of old automobile tops, and make them weatherproof. Material treated with this dressing will not crack in folding, and the preparation is absolutely non-injurious to any kind of fabric. It is easily applied and dries quickly to a durable, pliable, waterproof finish. This is just the thing for leaky, moisture-holding mohair tops, and it is made in eight standard colors, also special shades to order. Readers are urged to write for free color card and prices. The same manufacturers also make the "Evernew" Auto Top Sizing for a first coat on mohair, cloth or canvass tops that have never been painted, and the "Evernew" Auto-Body Enamel for application to the body of the car, which is also made in colors corresponding with those used in the "Evernew" Dressing.

Air Compressor Installations.

A new bulletin, or booklet, entitled "Air Compressor Installations," has recently been brought out by the Gardner

Governor Co., Quincy, Ill., and this will be found extremely useful to any garage owner as it gives full technical and mechanical directions for installing air compressors properly and to the best advantage. We understand that this booklet will be mailed free to any of our readers who will write for it direct to the Gardner Governor Co., and we hope that many will send in for it.

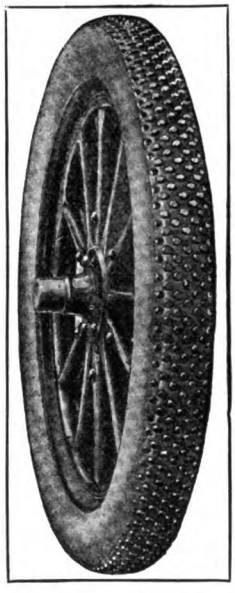
Stop! Don't Part With Your Half Worn Tires

Don't sell your worn tires to "Jimmy the Junk Man"—it's just as unnecessary—just as extravagant—to sell your tires when they get rim cut or rut worn as it is to throw away your shoes when the first sole wears thin, for you can NOW get 5,000 miles more service out of them by doing what European motorists have done for the past three years. This will result in a saving of $50.00 to $200.00 a year for you.

What European Motorists Are Doing

For three years European motorists have been getting from 10,000 to 15,000 miles out of a set of ordinary rubber tires, while American Motorists have been getting only from 3,000 to 5,000 miles, and—what is perhaps more important—have almost entirely eliminated the constant dread of punctures, blow-outs and rim-cuts.

In the past 9 months over 20,000 American Motorists have followed their example—and are "half-soling" their tires with "Durable Steel Studded Treads" just as we "half-sole" our shoes when the original sole gets thin.



Guaranteed 5,000 Miles Without Puncture

To many motorists this fact is of more importance than the money saved by eliminating tire repair bills—the constant dread of puncture or blowouts spoils the joy of motoring. Each unnecessary noise—each bit of broken glass or sharp edged stone—each bump or "pop"—makes the man at the wheel think of tire trouble FIRST.

Durable Treads are backed by a signed guarantee—as good as a Government Bond—for 5,000 miles **without** puncture. Think of the joy of motoring when you KNOW in your own mind that your tires are **impervious** to the roughest roads—when you KNOW that **you** won't have to get out and sweat fixing a puncture or blowout, besides, you save nearly enough to pay your yearly gas and oil bills, and the guarantee holds good no matter whether your tires are new or old, rim cut or rut worn.

No More Skidding

"Durable Treads" are as sure-footed as a Rocky Mountain Burro—look at the photograph—they're simply BOUND to be safe—the sharp-edged steel rivets make skidding almost impossible. With Durable Treads on your tires you receive **perfect non-skid** service while your tires are **protected instead of injured,** and you don't have to get out in the mud and put on chains.

Strong, Sturdy — impervious to the worst roads, "Durable Treads" add a touch of distinction to any car—and make the tires the much desired over-size.

We Ship On Approval

We ship on approval to any motorist—without one cent of deposit—prepay the express—and allow you to be the judge. Durable Treads are easily applied in your own garage, without special tools, in thirty minutes.

If your tires are new then protect them from cuts and punctures by putting on Durable Treads at once—don't wait until they are all shot to pieces. **If they are old and rutworn** don't sell them to Jimmy the Junkman—remember that "Durable Treads" are **guaranteed** for 5,000 miles without puncture—no matter whether your tires are old or new.

Special Discount Offered

To motorists in new territory where "Durable Treads" have not been introduced we offer a special introductory discount. The sales of "Durable Treads" increased 917% in the United States alone during the past year—over 40% of these sales were **unsolicited**—made through the recommendation of "Durable Tread" users. Where is there **another** automobile accessory that has received such universal, country-wide endorsement?

Mail the Coupon

Let us make you a special introductory offer. Let us give you a demonstration of "Durable Treads" **at our own expense.** Let us make you an offer so fair and square that you do not stand to lose one red cent, either before or after you buy. Act NOW—don't run your tires "barefooted" another week. Tear off the coupon, sign and get it in the mail box today—if you haven't got a pen or pencil handy tear off the coupon anyway and then sign it later—it will be the means of adding 5,000 miles to the life of the tires on your car.

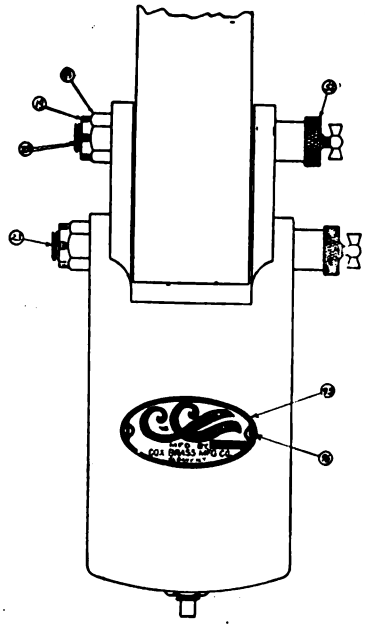
The C-C Shock Absorber.

The Cox Brass Mfg. Co. of Albany, N. Y., offers an improved form of the C-C Shock Absorber that has already won wide popularity. In the extensive trials made with the new type before it was offered to the trade, it developed such superior riding qualities that the manufacturers unhesitatingly say it is the best they have ever turned out. Besides the regular guarantee against mechanical defects, it is guaranteed to be absolutely noiseless and "rattleless." Every posible care that the experience of years in manufacturing shock absorbers could suggest has been taken. The head and cylinder are made in one. There are no joints to weaken. A special feature is the piston that combined with the long slide bearings makes it positively imposible to have any lost motion or rattle. This piston works smoothly in the body. The two parts are machined accurately to size. The size of piston rod is 2x¾ inches, insuring increased bearing surface.

In the illustration it can be seen that while the longer bearings on the staples prevent play, this increased length at bearing together with the enlarged piston absolutely minimizes chances for wear. Now, the piston with the machined bearing surfaces makes the sliding parts absolutely proof against the lost motion that produces rattles.



The Cox Co. maintains that it is not practical to make Shock Absorbers of

Plan View.

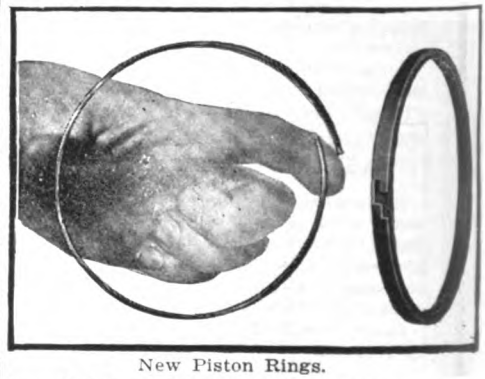
one standard width and size of spring bolt and then shim out to fit the various different requirements of cars. Instead, they make the Shock Absorber for spring widths of 1¾, 2, 2¼ and 2½ inches with the various sizes of shackle bolts; thus, insuring the proper set of Shock Absorbers for the car. Time has enabled them to perfect a series of five springs, which when worked in combinations of three carry the weight of the car prescribed for. This company publishes charts and directions for their dealers, which clearly set forth the changing of springs and fitting for the various cars. This chart has been carefully compiled and covers the attaching of C-C Shock Absorbers for various cars thoroughly.

The triple helical springs that have done so much to give C-C Shock Absorbers their widely merited use and high reputation are retained unchanged and a larger bearing surface afforded for

The C C Shock Absorber.

their support. The extreme bottom of the case is open to allow making the proper adjustment of the springs for the car weight it will carry. The shackle bolts by which it is attached are specially milled and drilled so that the grease cups with which they are furnished supply proper lubrication to the spring connections. This is a feature that is found elsewhere only in the very highest priced absorbers and one that is of marked value to the motorist. As shown in the illustration the new C-C is simple, substantial and good looking. Car weight has no terrors. It has been used successfully on the heaviest types of limousines. The price on the new model has not been advanced, but remains at $10 the set. Its many features of excellence can perhaps be best summed up in the words of its manufacturers who say, "The C-C has everything in its favor, even the price."

Curtis Garage Air Compressor.



This is a thoroughly reliable device, and it is guaranteed to furnish your customers with air free from oil or other impurities. This compressor is made in five sizes and forty different combinations, and there is one to fit any requirement. Some of the advantages of this compressor are found in its mechanical construction. It has an unloading device which saves power and permits the use of a smaller motor, which means cheaper air. The fan flywheel means cooler discharge air and higher efficiency at less cost. The compressor also has a safety cage so that a broken valve cannot damage the machine. It is made with inspectable valves and head removable without disturbing pipe connections. It also has adjustment, die-cast, anti-friction bearings and an oil level indicator. Probably your jobber can supply you with one of these air compressors, but you are urged to write for full particulars directly to the manufacturers, the Curtis Pneumatic Mchy. Co., 1530 Kienlen Street, St. Louis, Mo.

The Grace Pneumatic Controller.

This device consists of a small flexible tube leading from the steering post or dash of automobiles to an enlarged pipe or heater placed on the exhaust manifold or hottest part of the engine. From the opposite end of this heater or drum, the tube is continued to the intake manifold just above the carburetor where the air warmed in its passage through the tube unites with a warm mixture from the carburetor, vaporizing and making its more volatile and highly explosive. The manufacturers claim that this is the most efficient gasoline saver, decarbonizer, primer, air brake, and carburetor controller possible. It does not burn the fuel; it explodes it. It is simple and effective in operation, and has no moving parts. To operate you simply open or close the valve. The price of this controller post paid is $10 and it is manufactured by Grace & Company, 3205 W. Washington St., Los Angeles, Calif. Readers are urged to write for descriptive circular.

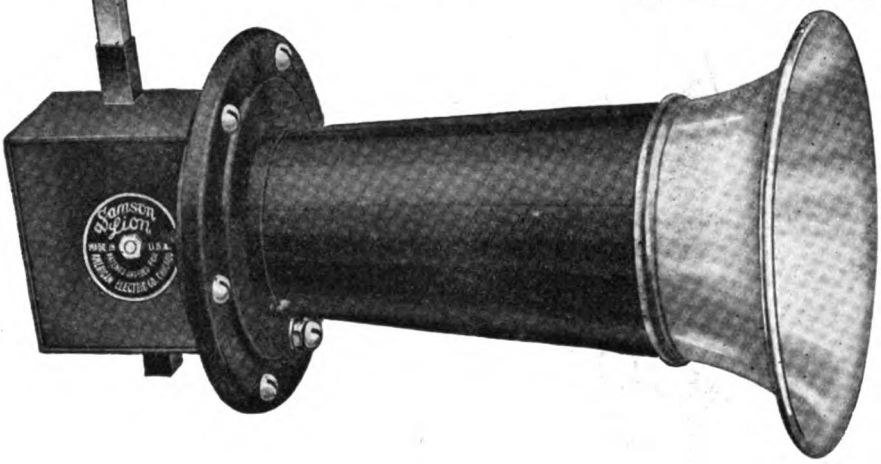
Davidson's Multiple Piston Rings.

These rings, illustrated herewith, are designed to preserve every ounce of power generated by the combustion in the engine. Every essential that can enter into the manufacture of a good piston ring has been obtained and utilized in making these rings, and the material used has been compounded after thirty years of study and experience in the mixture of metals. It is claimed that no matter what the age of your motor, the Davidson multiple piston ring will practically renew its power plant, and save hundreds of dollars, giving

New Piston Rings.

less friction, less wear, less heat, more compression, more power, and more mileage. Interested readers should write for full particulars to Davidson's Repair Shop, 227 West 64th Street, New York city.

Martell Aligning Reamer.



This is a device which will soon pay for itself in any repair shop or service station, and it is especially adapted to take the place of the ordinary method of scraping bearings by hand. This reamer insures absolute alignment of bearings, accurate size, perfect gear mesh, and produces truer and smoother bearings than could possibly be obtained by hand work. Readers are urged to send for an interesting free booklet, entitled "The Better Way to Scrape Bearings." Address all correspondence to the Harding Manufacturing Co., 40 Court Street, Boston, Mass.

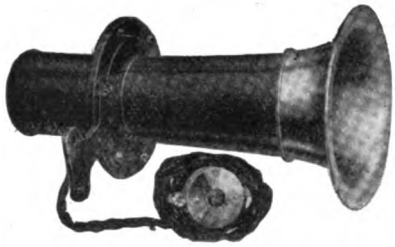
Buy Entire Line from One Factory

As to whether a motor-driven vibrator or hand actuated type horn is best we need not argue, as we make all types. We have continued to add to our various horn models until we now make the most extensive line on the market. **Bulk your orders. Buy your entire line from one factory.**

Samson-Lion
Automobile Hand Horn

is built up to a standard not down to a price. Mass production has made our fair lists and money-making discounts possible; it has permitted the subdivision of the various manufacturing operations so that we now have maximum production at a minimum cost. This means bigger profits for you; it means repeat orders from your customers.



Some horns have as many as four gears to catch, break or wear out. Only one shaft is used in this 1916 horn—the Samson-Lion. The pinion and strike wheel are cut from solid pieces of special high grade steel, afterwards case-hardened, and every tooth on the strike wheel is ground to a clean edge, so it will absolutely produce a uniform tone. The pressed steel rectangular back is small and neat, it does not protrude in way of driver.

If you haven't ordered your initial stock of Samson-Lion Horns, do so today. Now is the time. Not tomorrow, next week, or next month, but now. Write for some horns today; talk horns to your salesmen and your customers—then watch the results.

No. 45 Samson-Lion "Push-Down" Horn. Length 9¾ inches over all. Attractively finished in black with nickel trim. List price complete, **$4.50 LIST**

WRITE FOR CATALOG OF COMPLETE LINE

SAMSON JR. MOTOR-DRIVEN HORN
A Bigger Horn with a Bigger Motor

The tone volume, the finish and the motor are unequalled in any motor horn sold at a nearby price.

No. 23 Samson Jr. Length 10¼ inches over all. Complete with push button and 10 feet of duplex cord. List price complete, **$10.00**

THE VICTOR VIBRATOR HORN
We have simplified the parts and compressed all the essentials into a casing about the same dimensions as our "Samson Jr." motor horn.

A wonderfully low priced vibrator horn. Write for money-making discounts today.

No. 16 Victor Vibrator Horn. Length 10 inches over all. Finished in all black or black with brass or nickel trim. Complete with push button and 10 feet of duplex cord. List price - - - **$4.00**

A Machine for Sewing Tire Treads.

Shown herewith is a rear view of machine No. 98-2 manufactured by the Singer Sewing Machine Company, especially for sewing treads on used tires of automobiles, and the usefulness of this machine in any repair-shop is too obvious to need comment. With this machine two old tires can be used to make one re-treaded tire. A tire having a good foundation of fabric and beading is selected and another tire with a sufficiently good rubber exterior is utilized as the tread, after about an inch has been trimmed from each of its clincher edges. The improvised tread is placed outside the "fabric" foundation, and the tread is then stitched on firmly by the machine. To illustrate the work more completely, is shown a section of the re-treaded tire with the firm lock stitches. The first line of stitching is usually made about a half inch from each edge and about half inch space is allowed between the lines of stitching. Many tire repair establishments are making a specialty of reconstructing two old tires which have been discarded by motorists and it has been found a very profitable business. This machine will put the repairman in a position to take up this line of business and it will pay for itself in a very few weeks. The machine is fitted with a Singer Driving Attachment which enables the operator to run the machine by pressure on the treadle. The Singer Sewing Machine Co., which manufactures these machines, has branches in nearly all the large cities of the country, but readers are requested to write for prices and full particulars direct to the Singer Sewing Machine Co., Room 3508, Singer Building, New York City.

Tire Tread Sewing Machine No. 98-2. Rear View.

Section of Retreaded Tire, Showing the Firm Lock Stitches.

The Poor Man's College.

Thomas A. Edison, who ought to be an authority on such matters because he certainly rose from the ranks and is a self-educated man, says, "Instruction by correspondence is the cheapest and best way for the poor man." If this is admitted, it is certainly a great argument in favor of the International Correspondence Schools located at Scranton, Pa. They provide a large variety of correspondence courses, covering almost every technical subject. In this issue of our magazine an advertisement appears from the International Correspondence Schools which contains an application coupon giving you an opportunity to indicate the course in which you would most likely be interested. If this coupon is filled out and mailed to them, they will be glad to furnish full information. Address all correspondence to International Correspondence Schools, Box 7751, Scranton, Pa.

New Car Company at Fostoria, Ohio.

The Fostoria Light Car Company has been recently incorporated with a capital stock of $500,000. They have taken over the holdings of the Fostoria Storm Buggy Company, and they will start with a plant capable of turning out twenty cars per day. They will make five types of cars, touring cars, runabouts, delivery trucks, roadsters and coupes, and their prospects for business appear to be bright.

Old Sol Electric Spotlights.

With these lights you can spot danger by a turn of the wrist, as the lamp may be turned with ease at any angle, enabling the motorist to detect danger on all sides, also to read signboards and house numbers, to supplement dimmed headlights. The device may also be quickly detached and used as a trouble light. The 5-inch model for Ford and other light cars sells for only $3.50, while the 7-inch model for larger cars is sold at $6.50. This is an especially quick seller for dealers, as sales are stimulated by the use of an Old Sol Spotlight Silent Salesman, which is a handsome illustrated colored display stand which is given absolutely free to Old Sol dealers. This is but one of the many benefits to be derived from a real dealer co-operation plan offered by the manufacturers. Write today for full particulars to the Hawthorne Mfg. Co., 4 Spruce Street, Bridgeport, Conn.

The Aerofram.

This is a gasoline saver, which feeds air automatically into the intake manifold after the mixture is formed. One gallon tests have been made on automobiles of ten different makes. The lowest added mileage was 2.4 and the highest 5.7 per gallon. It is also claimed that the Aerofram makes motors run more smoothly when throttled low. A guarantee is packed in every box with this instrument, and money will be refunded if not satisfactory. Good agents are wanted everywhere. The Aerofram retails for only $1, and can be attached to any car in ten minutes. Write for prices and discounts to the Aerofram Co., 755 Boylston Street, Boston, Mass.

Small Trucks to be Made by Standard Company.

The Standard Motor Truck Co. of Detroit, Mich., which has heretofore given its entire attention to the heavy type of trucks, will soon place upon the market a light truck for which there is likely to be a large demand. This will be a new two-ton worm-drive truck. Mr. Vincent Link, formerly truck engineer of the Packard Motor Car Company, designed this new model, which includes many new and original features, yet is standard in design and made up of standard units. For the manufacture of this truck the company has contracted for the extension of their factory building, also for new machinery equipments. These light trucks would make an excellent line for many dealers to handle, and any who are interested should write direct to the manufacturers, the Standard Motor Truck Co., 496-500 Bellevue Avenue, Detroit, Mich.

Edelmann High Grade Automobile Specialties.

A very large line of useful accessories is manufactured by E. Edelmann & Company, 341 East Ohio Street, Chicago, Ill. This line includes the Break-Not Syringe Hydrometer, which is made with new construction, which will eliminate 99 per cent of the breakage. This company also manufactures stationary and adjusting cones for Ford cars, ornamental hub caps for Ford cars, bushings for Ford cars, ball races and retainers also for the Ford car. Ford dealers are especially urged to send for prices and discounts, and every reader of this paper should write for their interesting 1916 catalog, direct to E. Edelmann & Co. at the above address.

MERIDEN, CONN.

COLD WEATHER.

Modern Improvements Make it Easier to Start the Engine.

"The unpleasantness of cold weather starting has been eliminated by better motor design," states F. N. Nutt, chief Engineer of The Haynes Automobile Company, Kokomo, Ind.

"Automobile engineers have done a great deal of experimenting in order to make easier the starting of cold motors. As a result there are cars having carburetors designed in correct relation to the motor, ignition that is reliable even on the lowest motor speed, and easily accessible priming devices.

"Carburetion is naturally a big item for cold weather starting. Gasoline will flow at low temperatures, but its vaporization is difficult to draw into the motor on cold days. Hence, the long intake manifold is practically useless as the gasoline vapor, on striking its cold walls, condenses and flows back to the carburetor. This obstacle has been overcome by having the carburetor directly connected to the cylinder block and therefore at the nearest point to the cylinder chambers.

"Methods to produce carburetion have also undergone changes. Water was used in some instances to flow around the carburetor. The more simple design of using hot air from the motor has superseded this, however, giving better results.

"Ignition is a factor to be considered in easy motor starting. Magnetos are admitted to be reliable when the motor is running at a high speed, but not when it is being turned over slowly by the starter. Dry cells are only reliable when at their full power and to have this requires frequent renewals.

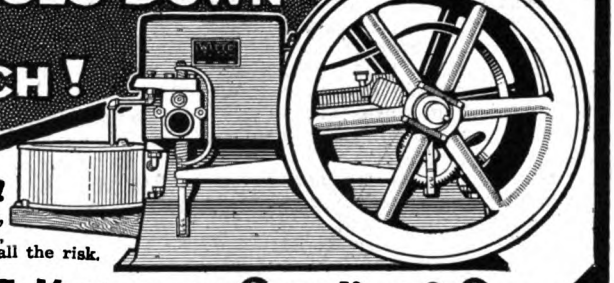
"Low speed ignition that has proven reliable for easy starting has met with success in the generator storage battery system. This method gives a good hot spark at all times and serves the purpose of starting the motor at once even if only a lean gasoline mixture exists.

"The old time method of priming the motor by hand may be replaced by a cowl board control that operates the carburetor in such a manner that the raw gasoline is drawn directly into the motor. Besides the accessibility of the device, more easy starting also is brought about.

"Automobiling is becoming a national sport that is followed at all times by people in all climates. To meet the demand, followers of the sport are becoming critical in their selections, and the car used must be capable of withstanding varying conditions."

Renewed Gears.

Nothing can be done with badly-worn and noisy gears that will effect any appreciable improvement. All that can be done is to run them in fairly heavy lubricant. This will deaden the vibration, but as the noise is the result of backlash between the teeth nothing, except renewal, is of any real use.



Worn or greasy brake bands should be inspected and tried, and adjustments not delayed but made immediately when needed.

An ordinary match is just the right size to push up the settlings that clog and drain cock on the radiator. But be careful the match does not break off.

STANDARD EQUIPMENT IN THE Packard "Twin Six"

BURD RINGS

Induce a Material Saving in gas and oil bills. Frequent careful and thorough tests have repeatedly proven that fact beyond question.

But the greatest saving following their installation is not so readily perceived—yet it is highly more important to the car owner than mere waste of fuel and lubricant.

The Metallic Guard, standing sentinel at the ring opening, prevents the formation of carbon resulting from burned lubricating oil in the cylinder. Such destructive carbon formations—carbons that fairly grind away the working parts of the engine—are positively impossible when Burd Rings are used.

Only a sufficient quantity of oil to lubricate the parts is allowed to pass. The surplus simply can't get by. It runs back into the crank case to be used again—not burned.

No motor—old or new—will generate its maximum power, attain its highest speed, operate at minimum cost or continue in service as long as it should unless Burd Ring Equipped.

Burd Ring Performance is warranted. Ask for a copy of the warranty. Its the strongest claim ever made for a piston ring, and it is backed by the largest manufacturer of Patented Piston Rings in the United States.

BURD HIGH COMPRESSION RING CO. Rockford, Illinois

Makes Old Bearings as Good as New.

Old, worn-out annular ball bearings may be made practically as good as new by regrinding, and the Ahlberg Bearing Company, 2643 Michigan Avenue, Chicago, Ill., makes a specialty of this work, which they do accurately, promptly and at a reasonable cost. By having your old bearings reground you can obtain a set of new bearings at one-fifth of what it would cost you for the new goods. The Ahlberg Bearing Co. also carries in stock a full line of new annular, thrust, radax and double row bearings, also high-grade steel balls, and they are in a position to make special bearings from specifications. Correspondence from our readers is invited.

Bell Touring Cars and Roadsters.

An interesting and attractive line of cars is manufactured by the Bell Motor Car Company of York, Pa. Their line includes a light 4 cylinder, 30 H. P. car with 112-inch wheel base, 4-inch tires, genuine leather upholstering, one-man top, full floating axle, spiral bevel, differential gears, high grade lighting and starting system, roomy stream line body designed by an engineer of world-wide experience. This company makes both roadsters and touring cars with these specifications, and they have a well-organized and financed company, and claim to make the most high grade popular priced cars in this country. They have a liberal proposition for dealers and some territory is still open. Correspondence from our readers is invited.

F-F Magnetic Rectifier.

It has long been the desire to charge small storage batteries from an alternating current and to do it without waste of current or bother. To this end the France Mfg. Co., Cleveland, Ohio have designed the new F-F Magnetic Rectifier, which is a radical departure from anything in this field and sells at a price exceptionally low for an instrument of this kind.

The transformer and magnetic rectifier are firmly mounted on a metallic base and enclosed in a neat case. The entire machine is rigidly constructed, small, compact and readily portable, measuring 5 by 6 by 9 inches and weighing only 12 pounds. It is also simple and foolproof and like an electric motor, has practically no maintenance or depreciation expense. It will run continually at full load and charge the average battery at a cost of from 5 to 15 cents, depending upon the condition and state of charge in the battery. It is perfectly insulated from shock and requires no attention. It is also safe to put a battery on charge over night, because the F-F rectifier automatically stops and starts in case the alternating current should be temporarily interrupted and opens and closes the charging circuit so that the battery cannot discharge through the rectifier. Where it is desired to charge several 6-volt batteries at a time or batteries of higher voltage, two or more rectifiers can be connected together.

New F-F Magnetic Rectifier for Charging Small Batteries from an Alternating Current.

Peerless Piston Rings.

These rings are guaranteed to maintain a tight high compression in spite of any climatic conditions, furnishing a reserve power than can only be proved when you try it. These rings are completely compression-tight and carbon-proof. They are simple, sensible, economical and efficient, and a money-back guarantee goes with each ring. Write for prices and concessions to Larson & Hilker, Distributors, 19 South La Salle Street, Chicago, Ill.

The Neverout Auto Radiator and Garage Heater.

This is a practical heating system which solves the cold garage problem, keeps the automobile warm in the coldest weather and makes the garage comfortable. It is low in price, and eliminates the necessity of a costly heating plant. With this device there is no need of leaking radiators, cracked cylinders, frozen-up bearings, burst water pipes, etc. It is portable, burns kerosene, and is extremely simple in its operation. Readers should write for interesting literature to Rose Mfg. Co., Dept. R, 910 Arch Street, Philadelphia, Pa.

The Carleton No. 68 Generator.

The special attention of readers is directed to this excellent generator, which is an easy solution of lighting problems. It is applicable to any car, cycle, boat or miniature stationary plant, and special brackets are made for Ford, Saxon and Metz cars, with special chain drive for Ford cars when desired. Write for full particulars to The Charlton Company, 180 Summer Street, Boston, Mass.

Mosco Specialties for 1916.

Many of our readers are already familiar with the large line of Mosco specialties, and some of the leaders for 1916 will be the Beamus Ball Contact Timer, also the Loose Plunger Type Wheel Pullers for Ford, Overland, Buick and Maxwell cars, and the Mosco Valve Grinder. This valve grinder is a tool which differs radically from others in many respects, but mainly in the fact that it can safely be used by those unskilled or unexperienced in valve grinding. It is really more of a machine than a hand tool and it renders valve grinding an accurate mechanical operation rather than a guesswork hand job. The price of this valve grinder is only $1.50, bringing it within the reach of every car owner who cares for his own car. For full particulars in regard to this and a very large line of specialties for Ford and other cars all bearing the trade mark name of 'Mosco," write for 1916 free catalog to the Motor Specialties Co., manufacturers, Waltham, Mass.

Electrical Supplies.

A full line of small electrical supplies and parts is manufactured by the Chicago Fuse Mfg. Company of Chicago and New York. This line includes "Union" auto fuses, contact clips, cutouts and boxes. Special electrical parts are made to order by this well known house, and the trade is invited to send blue prints or samples and get them to quote prices. Write for full description of the large line of electrical supplies manufactured by this firm.

Rayntite Folding Water Bucket.

How many times have you passed a water fountain or spring and needed water for your engine, but had no means of conveying the water to your machine? You remember the trouble you had getting a bucket. All such anxiety can now be avoided. The Du Pont Fabrikoid Company of Wilmington, Del., has just introduced a folding water bucket that serves the purpose and yet takes up very little room. It is made of waterproof Rayntite, their top material, and all seams are stitched and cemented with a special adhesive to prevent leaking. The bucket holds one and a half gallons of water and pours easily into the radiator head. Rayntite does not harden and crack, and the bucket may be folded and kept under the rear seat cushion so that it takes up practically no room. The price is 75 cents.

The Beartone for Ford Cars.

This is a horn and fan combined, especially adapted for use on the Ford cars. No gears, motor, battery or wires could give trouble with this horn. It gives a warning signal by merely pushing the button at the driver's seat. The Beartone sounds through the front of the radiator. It increases the efficiency of the fan and motor and keeps the radiator cool. It is easily interchangeable with the regular fan on any Ford in a minute's time. The same manufacturers make the Oakes Kranklock combination starting crank holder and lock and license holder, which makes the car thief-proof. This device holds the starting crank rigid and the license tag securely, and it is especially made for Ford cars. It can be put on easily in a few minutes. There are no holes to drill and it prevents garage employees from using or tampering with the car while in the garage. The Oakes Kranklock sells for 50 cents without padlock, or $1 with a special Yale padlock, and the Beartone retails for $5. A large number of other interesting specialties are made by the same manufacturers, and readers are urged to write for complete description of their entire line to the Oakes Company, Indianapolis, Ind.

A Spark Plug Detector.

The Carter Spark Plug Detector is the latest device now being placed on the market by the Carter Spark Plug Detector Co. of Detroit, Mich. This automatic instrument is very simple in operation and any one not experienced with ignition system of gasoline engines can quickly determine the spark plugs that are firing from those that are missing. This instantly places the motorist at the very root of motor troubles by proving out the spark plugs first, thus finding and replacing the missing ones with clean plugs eliminates the uneven running of the motor. This detector is the latest invention of H. O. Carter, who has designed a number of successful cars during the past ten years. Having found that the prevailing custom among the great majority of gasoline engine users is to condemn the carburetor first, while the ignition system with its complications is the last to be examined.

Carter Spark Plug Detector.

The "Invincible" Blow-Out Patch.

This new patch is described as a wonderful seller for garages and dealers. It solidly binds itself to the fabric of the tire; is attached from the inside and clinched on the outside. The manufacturers state that this is proving a whirlwind profit producer for all garages, dealers and repairmen and you are urged to write immediately for terms to R. B. Hutchinson Co., 323 Penwood Avenue, Wilkinsburg, Pa.

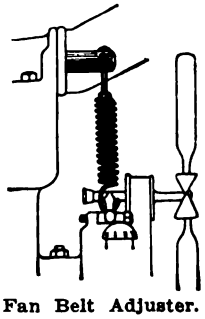
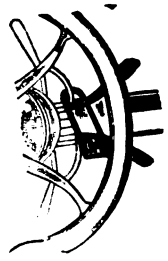
New and Useful.



The Auto Parts Company, Providence, R. I., maker of the well known line of Apco specialties for the Ford car, is marketing three new devices which will appeal to owners because of their practicability and moderate cost. Two of the

Belt Retainer.



devices are applied to the fan belt assembly, the belt retainer being designed to prevent the belt from jumping or leaving the pulleys. The device is attached to a crankcase bolt and is adjustable to position. It retails at 20 cents.

The automatic fan belt adjuster maintains the proper tension and after instal-

Fan Belt Adjuster.

lation does not require any attention until the belt wears out. The maker claims that it will increase the life and efficiency of the belt, can be easily installed and will prevent rattling of the fan belt assembly. The spring is of imported steel and is guaranteed to operate

Spark and Throttle Lock.

as represented. The device sells for 40 cents. The Apco spark and throttle lock retains the levers in a fully advanced position as shown in the illustration. The device is easily fitted and prevents practical use of the car as the spark is so far advanced that the motor would not operate without danger. The device includes a high grade lock and keys. It retails at 60 cents.

C-Cleer for Safety.

C.-Cleer is a compound for application to the glass of the wind shield, which keeps the glass transparent at all times and prevents the dangerous conditions which often prevail in cold and stormy weather. For safe driving it is necessary to have a clear view of the road through the wind shield, and by using C-Cleer this desirable result can always be obtained. C-Cleer sells for only 25c per can, and should be carried in stock by every dealer in auto supplies. The compound is packed two dozen to a counter display box, and these boxes present a very neat appearance. Dealers are especially urged to write for particulars and discount, and address all correspondence to the Sole Manufacturing Co., New York.

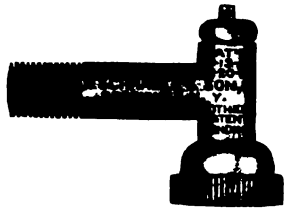
Fowler Quality Searchlights.

These lights are highly recommended by all who have used them. The lamps are made of all brass and will not rust, and each lamp contains a 400 spot light, with a 24 candle-power Mazda Nitrogen Bulb. The Fowler Swivel Joints are made with strong compression coil springs, providing an even tension and always flexible swivel bracket. Any combination of radius and angle, forward, back or to the side, may be obtained, which is not the case with other lamps. Readers who are interested should write for prices and full particulars direct to the general distributors of these lamps, the Monarch Motor Parts Co., 2332 South Michigan Avenue, Chicago, Ill.

White's Permanent Top for Ford Cars.

This is a complete new top for the Ford car. It is described as a perfect limousine top for winter and better than a one-man top for summer. It is light but strong and fits the irons already on the body. It can be attached by anybody without mechanical skill in a few hours' time. It is made of fine warm mohair of best quality. The doors and frame are of wood covered with mohair, giving the entire top a rich, soft appearance. The windows, which are of glass, fit snugly and will not rattle. In short, it is a perfect top for winter motorists who own Ford cars. This top is marketed by the Arsenal Varnish Company, 2501 Fourth Avenue, Rock Island, Ill., and this is the same company which also has a system for the home painting of motor cars. Readers may obtain free of charge, by writing to this company, a big 36-page book, entitled, "The Car Beautiful," which will show how old cars may be improved and renovated without the expense of carrying them to a shop to be repaired and repainted.

Want Business Literature.



The Cycle and Motor Trade Supply Company, Wiener's Building, Lower Burg Street, Cape Town, South Africa, desires our advertisers who have goods which they could sell, to send them catalogues and price lists. They say they are so far away that it takes a long time after they have written a letter before they get a reply with the literature desired. These people are wholesale dealers and refer to R. G. Dun & Company, of this city, for their financial standing.

New Distributors for Gray & Davis.

The New York branch of Gray & Davis, Inc., formerly located at 245 West 55th Street, has been discontinued. and P. J. Durham Co., Inc., of 244-250 West 49th Street, have been made distributors of all Gray & Davis products for the metropolitan district. The entire stock of the former branch has been transferred to the Durham Co., and a full line of Gray & Davis lamps and Ford electric starters, as well as repair parts for all Gray & Davis starting and lighting systems, will always be kept in stock. H. B. Shontz, formerly with the C. T. Silver Motor Co., and the Willis-Overland Co., have joined forces with the P. J. Durham Co., and will have charge of the sales and other business.

The New Schrader Universal Pump Connection.

In addition to a complete line of their justly famous tire valves, A Schrader's Son are exhibiting the Schrader Universal Tire Pressure Gauge, the Schrader Quick-acting Dust Cap, the Schrader Valve-repair Tool and a new and improved pump-connection which will be in the hands of the jobbers by January 1 and be known as the Schrader Universal Pump Connection. This latest of Schrader products is a patented device, which may be attached to any and all pumps now in use, for inflating automobile, motorcycle or bicycle tires. It screws on the end of the rubber tubing of the pump and connects with the tire-valve by means of a swivel nut. A deflating

pin directly over the vertical arm of the apliance permits the taking of the pressure in the tire while the pump is still attached to the tire and in operation. The motorist pumping up a tire will thereby be saved the labor and annoyance of detaching the pump from the tire to test the degree of its inflation and of re-attaching it in case the tire is found to need more air. The price to the consumer will be 35 cents.

A Profit Producer.

The manufacturers of the Waterhouse Welder state that this outfit is a profit producer for any blacksmith. If you want to be really up to date and get all the best repair work in your neighborhood, you certainly need a welding outfit, and this one is thoroughly reliable, while the complete outfit sells for only $42, with rods and fluxes $4.50 extra. Think of the work you lost last month because you did not have a welding equipment in your shop. This outfit has enabled many blacksmiths to add largely to their incomes and there is no reason why many of our readers should not get the same advantage. Write for full particulars and descriptive literature direct to the Waterhouse Welding Company, 16 Pelham Street, Boston, Mass.

Temporary Injunction Issued.

A temporary injunction has been issued in favor of the Prest-o-lite Co. of Indianapolis, against the Sun-Lite Gas Co. of Louisville, Kentucky, by the U. S. District Court for the Western District of Kentucky. The Louisville company is enjoined against refilling the Prest-o-lite tanks, unless they destroy the identity of the Prest-o-lite cylinders and have them properly branded with the Sun-Lite name.

No-Leak-O Piston Rings.

There is no doubt but what good tight piston rings will increase power, decrease fuel and also decrease the amount of oil used on any motor. The No-Leak-O Piston Rings have a special construction and they are highly recommended by motorists who have used them. They are made with grooves and the volume of oil in the grooves act as a packing against the oil being drawn or forced up into the firing chamber. Perfect lubrication is thus attained without waste. Each ring is guaranteed for quality, accuracy and satisfactory service and the manufacturers state that where these rings are used there will be no smoke in carbon, no oily spark plugs, and no necessity of frequently grinding the valves. Write at once for complete particulars to the Automobile Accessories Co., 816 West North Avenue, Baltimore, Md.

"Little Wonder" Special Battery.

This is a storage battery for your car which well deserves its title of "Little Wonder." The retail price of this battery is only $7.50 and it is claimed that it is equal in value to other batteries that retail for double the money. This battery weighs only 21 pounds and has a 6 volt, 60 ampere hour capacity. A sample battery will be sent to any responsible dealer at the wholesale price for a trial. The battery will also be sent to any automobile owner on receipt of the retail price, or with bank reference one will gladly be sent on trial. The same manufacturers make all sizes of batteries in addition to the "Little Wonder" and will be glad to quote prices. Ask for Seven Important Reasons Why you should own one of these batteries and address all correspondence to the Wright Rapid Fire Storage Battery Co., Tiffany Bldg., 96 Market Street, Poughkeepsie, New York.

Digitized by Google

New Rhoades Battery Ignition System.

The New York Coil Company of 338 Pearl Street, New York, have entirely redesigned their Rhoades Battery Ignition System, which they have been marketing for the past six years. This System is particularly adapted to Ford cars, and includes necessary fittings to enable its installation in one hour's time.

The novelty of this ignition device consists of the peculiarly constructed circuit making and breaking mechanism, as but one intense spark is produced for

each ignition, entirely independent of the speed at which the engine is revolving. No spark whatever is produced, should the engine turn in the reverse direction. A further feature of great merit is the fact that the device never stops with the battery circuit closed. Accidental draining of the battery by forgetting to turn off the switch is therefore an impossibility. The makers claim it contains

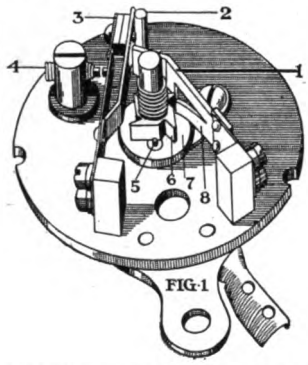

FIG-1

fewer working parts than any other single spark system on the market, which by reference to the cut would seem to be a true assertion.

A hardened steel arm, Fig. 1, is supported on the base by means of a tempered flat spring. Near its center a lip is formed, which is engaged by the cam 6. When the shaft 7 is revolved clock wise, this cam moves the arm outward until it slips off the tooth, when it is returned by the spring, striking the contact, carrying member 3 a sufficiently hard blow to swing in contact with the contact screw 4, closing the circuit for a brief interval, and immediately opening same, which causes the non-vibrating transformer coil to produce an intense flaming spark.

A hardened tool steel pin 5 compels the cam to revolve with the shaft when driven in the proper direction. However, should the engine turn backard the cam remains stationary, as surfaces suitably shaped on under side of cam allow the pin 5 to be forced downward without moving cam, therefore no spark is produced in backward rotation. Glass hardened parts are employed on all wearing surfaces, and as these are of very large dimensions and subjected to a perfect natural mechanical action long life of the device is assured.

The makers state the device has undergone an unusually severe test, extending over a period of one year, and guarantee the system to produce 2,000 to 4,000 miles running on the current supplied by one set of six dry cells. The price is $20 complete, which includes transformer coil, the described instrument and elevating oil type bracket containing cut gears with all necessary cables, wires and fittings, as well as a very neat metal tube, which supports the wires in a neat workmanlike manner above the cylinders.

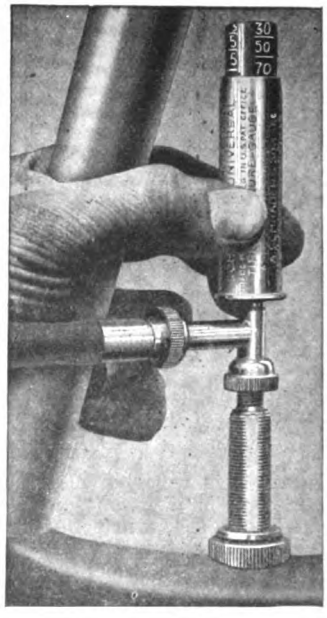
Something New

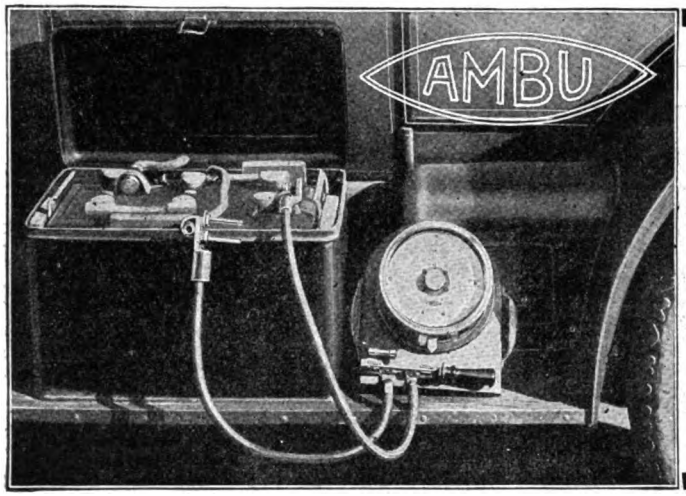
After long study and many experiments to find some attachment or device that would permit quick and at the same time *accurate* pumping up of tires, we take pleasure in announcing the placing on the market a pump connection which at last satisfies us and to which we can lend our name.



THE NAME SCHRADER is a guarantee of quality.

The new **SCHRADER UNIVERSAL PUMP CONNECTION** is a patented device which may be attached to any and all pumps now in use for inflating automobile or motorcycle or bicycle tires. It screws on to the end of the rubber tubing of the pump, as shown in the illustration, and connects with the tire-valve by means of a simple swivel-nut. In combination with the contact with the tire-valve, is a deflating pin which permits of the pressure in the tire being taken while the pump is still attached to the tire and in operation.

The motorist pumping up a tire will thereby be saved the labor and annoyance of detaching the pump from the tire to test the degree of its inflation and of re-attaching it in case the tire is found to need more air.



The **SCHRADER UNIVERSAL PUMP CONNECTION,** as the cross-section view will show, is equipped with regular check valves so that in no way can there be any leakage when the pressure gauge is applied. It is offered for sale to the consumer at 35 cents, and extensive advertising in national and automobile magazines will be undertaken to foster and develop the brisk demand already existing.

SCHRADER UNIVERSAL PUMP CONNECTIONS will be in the hands of jobbers after Jan. 1, 1916. If your jobber happens not to have them in stock, please write us direct, (giving his name) and we will see that you are supplied.

A. SCHRADER'S SON, Inc., 785-795 Atlantic Ave., Brooklyn, N. Y.

You Won't Need to Turn Down Another Electrical Repair Job if You Own

AMBU

TRADE MARK

Electric Trouble Shooter

You have struggled along day after day facing those difficult problems of repair work on the electric starting and lighting systems of automobiles.

Many you could not handle.

You have wasted hours trying to find the trouble.

You have not charged half of what the job is worth.

You have held up the owner's car one or two days because you could not quickly find the trouble and correct it.

You have been handicapped because you have had to depend on **your** knowledge of the various systems in the various cars.

Of course you can't know all about all of them—because there are about 250 places for trouble in every one of 50 or more types and adaptations of starting and lighting systems. Think of it—*a total of 12,500 possible troubles!* No one man can possibly know all of them and locate all of them, but AMBU, the Electric Trouble Shooter, does.

And AMBU will overcome for you all the troubles, all the worries, all the uncertainties you have been through in your attempts to solve difficult jobs of electrical troubles.

AMBU

will positively and accurately detect and locate the trouble in any electrical starting and lighting system standard on any American made automobile.

AMBU is a circular metal instrument easily and quickly attached between the battery and battery cable as shown in the accompanying picture.

The battery is the heart of the starting and lighting system.

AMBU goes right to the seat of the trouble and—

YOU DON'T HAVE TO TEST A HUNDRED PLACES FOR TROUBLE.

Because AMBU finds it at once—definitely, accurately and without guesswork. You read the dial of AMBU just as you read the dial of your watch and you read the truth every time.

Therefore, the possession of AMBU will add to your reputation as an electrical expert. Its business-like appearance, its quick action, will make and hold customers. Your work will bear the stamp of authority.

YOU KNOW WHAT YOU ARE DOING WHEN YOU USE AMBU.

AMBU Service

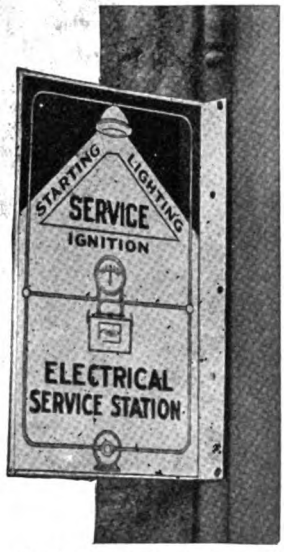
But AMBU—the instrument—is only one part of the broad, comprehensive service furnished by the American Bureau of Engineering—to make you the leader in the repair of troubles in the electric starting, lighting and ignition systems in automobiles in your community.

AMBU Service is really a complete education in the application, details and workings of the various types of starting and lighting systems as installed in the various makes of motor cars.

AMBU Service consists of AMBU blue-prints—showing the exact layout of every electrical system as applied to automobiles.

AMBU Repair Charts—giving concise and practical working information and complete instructions on how to make repairs quickly and positively.

AMBU Service Bulletins keep you posted on all changes, additions and improvements which may be made in the various systems.



AMBU Engineering Advice—to help you out of any unusual difficulties.

AMBU Instruction Book—compiled by experts gives you a complete working knowledge of the various makes and types of electrical starting, lighting and ignition systems.

The complete AMBU Service contains information impossible for you to obtain in any other way—classified, systematized, readily accessible, and filed in a handsome, substantial metal case with lock—a compact authoritative Service.

The possession of AMBU will benefit you to the extent of hundreds of dollars. It saves hours of time, makes an expert of you—it brings you hundreds of dollars of extra repair work because **you** know **how** to do the work.

With AMBU your garage or repair shop becomes a magnet drawing the desirable trade to you.

The Starting, Lighting and Ignition Service Sign

Your place of business is identified by a handsome, enameled sign furnished by the American Bureau of Engineering.

Car owners will learn to look for garages and repair shops displaying this sign—as the proper place to obtain dependable, authoritative repair work on the electric starting and lighting system.

Think of the quantity of other repair work too which will come your way.

Individualize your garage **now.** Get that trade with AMBU.

Hundreds of repair and garage men are now using AMBU.

If you are not—fill in the convenient coupon today for detailed information regarding this remarkable instrument and service.

LIGHTNING

GARAGE REPAIR SETS FOR FORD CARS

A complete assortment of taps, dies and reamers has been selected to meet the demand from garages and repair shops, and is based on their experience in handling repairs on Ford cars.

The tools are of

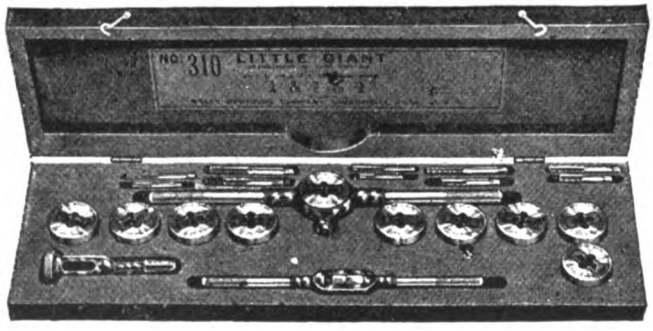
The Celebrated Lightning Quality

which have been in the front rank for nearly 45 years.

Contains:

Screw cutting sizes $\frac{1}{4}^{28}$, $\frac{5}{16}^{24}$ $\frac{3}{8}^{24}$, $\frac{13}{32}^{16}$, $\frac{7}{16}^{20}$, $\frac{7}{16}^{14}$, $\frac{1}{2}^{20}$.

Plug Taps and Round Adjustable Dies.
Spiral Fluted Reamers.
2-in-1 for spindle body and spindle arm bushing.
1 for piston pin bushing.
Stock for Round Adjustable Dies.
"T" Tap Wrench (Adjustable).
Weight 4¼ lbs.



WILEY & RUSSELL MFG. CO. Division

Little Giant COMBINATION ASSORTMENTS

Saves the cost of buying a separate outfit for each thread standard and the annoying duplication of stock and tap wrenches.

Each and every Die in the assortment is contained in its own collet.

A Bit Brace Die Holder is also provided in these assortments for convenience where it is desired to merely run over a slightly battered thread without removing the bolt or screw from its place in the car.

No. 310. 5 CUTTING SIZES

Perfection in a one-piece ring—at a lower price!

Why pay two prices for a piston ring in two or more pieces, when ***positive gas-tight*** service can be bought in this one-piece ring—at a lower price?

The Inland combines the strength and durability of the eccentric ring; with the uniform radial pressure of the concentric ring, and with all the permanently ***gas-tight*** qualities that any ring can have, of any number of pieces or at any cost.

A continuous ring, cut spirally for half its circumference and heat treated so that the free ends will hug tightly together. The result is a ring that uncoils in expanding, insuring uniform ***gas***-tight pressure and ***continually perfect*** contact with the cylinder walls. You cannot get, at any price, a more perfect gas-tight ring that will STAY gas-tight during the whole life of your engine.

The strongest ring on the market because it is made in one-piece; and because it has no weak or thin places; of uniform width and thickness all around. Made of close grain, elastic cast iron. Easy to install; will not break in handling.

Every Inland Ring is absolutely guaranteed: Money refunded on any ring that fails to give perfect satisfaction after 90 days' trial.

The need of new rings to replace the common type which come with most cars, is evident to any motorist after the first year's running. A set of new ***permanently gas-tight*** rings quickly pays its cost in more power, less carbon, and greatly increased mileage per gallon of gasoline and oil.

Install the Inland because it is perfectly and permanently gas-tight, and because its simple construction allows it to be sold for much less.

Write for illustrated booklet today.

INLAND MACHINE WORKS, 802 Mound St., St. Louis, Mo., U. S. A.

Dealers and Jobbers should write for interesting prices.

FORD OWNERS TAKE NOTICE!

The New Rhoades Battery Ignition System

For Ford Cars Is Ready

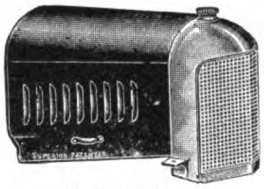
This system is new in its entire construction—in no way resembling our old model (or any prevailing design) yet all necessary qualifications of the Battery Ignition System, operated by six dry cells, are retained. This new Model "L" is a revelation in simplicity, reliability and battery economy—it contains no delicate parts subjected to wear, and will last as long as your car. Its effect on your Ford is indeed remarkable—you will at once notice a tremendous increase in **power, smoothness** and **flexibility** that you have never thought possible.

Your motor will throttle down to a walk, yet at a touch accelerate like a six—unevenly applied jerky power will be absent entirely, in a word your ignition troubles are **ended.** You get the same satisfaction enjoyed by the owner of the most expensive car, as all vibrating coils, their troubles and replacement of parts are **dispensed** with. It is operated entirely by six dry cells which supply sufficient current for 2,000 to 4,000 miles running – leaving the Ford Magneto to furnish lighting current exclusively.

We supply a transformer non-vibrating coil of great power, equipped with **kick switch,** also an oil type elevating gear bracket containing cut bevel gears, upon which is mounted our new sparker, also all cables, wire and cable carrying tube, with instructions that enable you to successfully install in one hour.

PRICE $20.00, thoroughly guaranteed

Attention Dealers



Our New Catalogue with 1916 prices is now ready. Send for copy and cuts. Our line covers real live wire business getters, embracing Master Vibrators, our Automatic Head Light Regulator, Lock Switch, and many other rapid selling accessories for Ford Cars.

MAXWELL TYPE

DEALERS

Do you realize that there are more than one million batteries sold at retail every year and that very few dealers are really pushing them? Do you realize the business you can get by going after this trade with a first class battery?

Detroit Batteries Are Made For Every Car And Starter

STUDEBAKER TYPE

There is a Detroit Battery made for every American car and starter. Detroit Battery dealers can supply any car in their territory. Sales possibilities are limited only by the number of cars. You can get this business if you go after it!

Detroit Batteries Test the Highest

Competitive tests prove the Detroit Battery first in capacity, first in capacity for weight and first in durability. The engineering expert who made the tests says: "Of all the batteries tested the Detroit is clearly ahead in capacity. On the basis of ampere hours per pound it is ahead of the majority by a large margin."

BUICK DELCO TYPE

Detroit Batteries Are Priced Right

All prices are net, printed plainly and mean what they say. There are no shifting discounts, doing away with bargaining methods and exorbitant profits to either manufacturer or dealer. The Detroit policy is based on fair dealing and has the confidence of both dealers and consumers.

Detroit Battery Dealers Are Cashing In On Our Proposition

We have an extraordinary proposition to make to live dealers. Write at once for full particulars. **Early** requests for territory will be given the preference.

ELECTRIC
DISCO
SYSTEM

"It SPINS the Motor"

For Starting and Lighting your FORD CAR

Disco Single Unit System, Simple, Light and Reliable.

There is always a start in the Disco. It employs the single unit system, simple, light, easily installed and reliable. It operates on a ***twelve volt current,*** spinning the motor no matter how cold the weather. It charges the battery at a low engine speed, insuring a full charge at all times. It is absolutely automatic in operation; with no adjustments to cause trouble. Its patent yoke bracket insures perfect alignment at all times and prevents chain breakage. It is strongly built and durable, and will give efficient service throughout the life of the car.

Link Up With The Pioneer Ford Starter

The Disco was a pioneer in the electric starter field. Disco equipment is now standard on eighteen American cars. Disco Ford Starters are relieving thousands of owners all over the country of the inconvenience of hand cranking and the old fashioned acetylene lights. Disco dealers are everywhere cashing in on the Disco reputation and are making the profits which come to a good product with a large demand. The Disco factory is amply equipped to make prompt and regular deliveries, and give good service of every kind. We still have some territory for a few more responsible and "live" dealers.

Starts the natural way with a touch of the foot.

CARBON
HART-BELL
REMOVER

A Success for the Dealer—
A Success with the Car Owner.

IT'S that kind of a proposition—for there's a **real** demand for a **real** carbon remover and car owners were quick to realize the value of the Hart-Bell Carbon Remover. Evidence of this is thousands of orders coming in from all over the country and countless letters of highest endorsement from users.

But we need more live dealers to help us distribute. We do not ask our dealers to buy our goods until they have felt the demand, so we have a special co-operative selling proposition that we will submit to the dealer who believes in being stocked and organized ahead of his competitors.

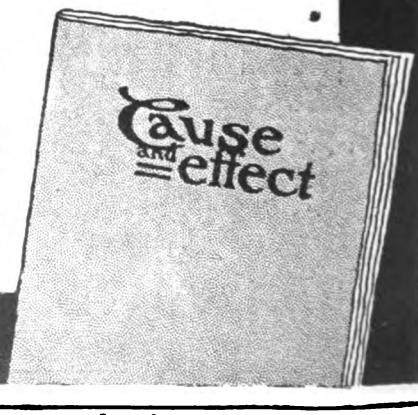
The HART-BELL CARBON REMOVER is a device for introducing live steam into the cylinders of the motor. Carbon cannot be dissolved, only loosened, and live steam is the best agency for loosening carbon. The carbon is then blown out through the exhaust while the motor is running. The HART-BELL CARBON REMOVER is permanently attached (you can attach it yourself), and can be used as often as desired.

There are two million car owners who will want the HART-BELL CARBON REMOVER just as soon as they hear about it.

A REAL BUSINESS OPPORTUNITY FOR LIVE DEALERS.
Write at once for our co-operative selling plan.

$5.00 COMPLETE

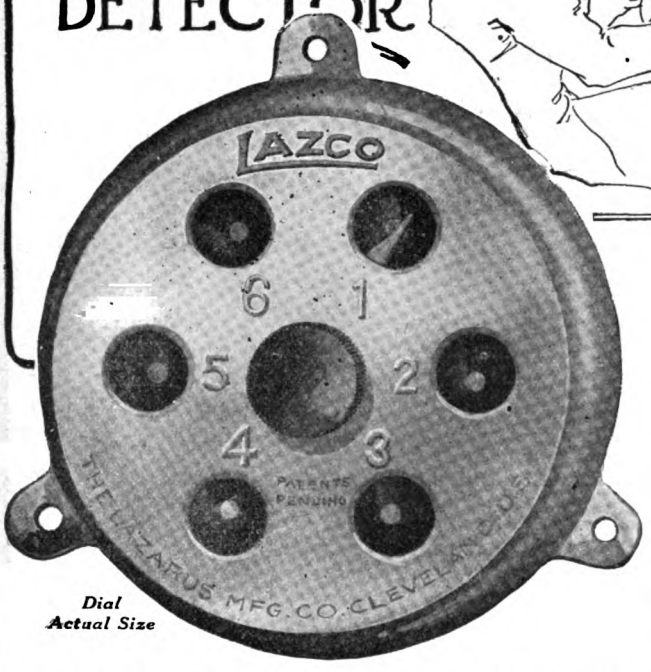
Satisfaction guaranteed or money refunded



Send for Free Booklet

"Cause and Effect," explaining the merits of the HART-BELL CARBON REMOVER.

See the Hart-Bell Carbon Remover at the Auto Show, at New York, 4th Floor, Booth D-220.



We guarantee that the HART-BELL CARBON REMOVER will do all that is claimed for it, and if found unsatisfactory the full purchase price will be refunded upon return of same, within ten days, to agent from whom it was purchased, or from us if purchased direct. You run no risk whatever.

White's Permanent Top For Fords

A LIMOUSINE TOP FOR WINTER—BETTER THAN A ONE MAN TOP FOR SUMMER

1915-16 Touring car $65.00, Roadster $50.00
1913-14 Touring car $67.50, Roadster $50.00

For Winter

White's Permanent Top for Fords is a complete new top. It is a perfect limousine top for winter and better than a one man top for summer. Is light but strong and fits the irons already on the body. Anyone can attach this top in a few hours' time.

White's Permanent Top for Fords is made of fine warm mohair of best quality. Doors and frames are of wood covered with mohair, giving entire top a rich soft appearance. Windows are glass, fit snugly and will not rattle. Door handles operate from inside or outside same as on most expensive enclosed bodies. Workmanship is by highest skilled coach makers and trimmers.

For summer use doors and windows are easily removed, making White's Permanent Top a better top than any so-called one man top. Nothing in the way from wind shield to back curtain. Summer side curtains furnished at reasonable price if wanted. This top is manufactured for us by the Geo. White Buggy Co., Rock Island, Ill., builders of high grade vehicles for years.

For Summer

If you desire to use your old top for summer, White's Top is easily removed.

Tops are boxed for shipment in crate 12 inches high. Immediate delivery.

Write for detailed description.
Order direct or through your dealer.

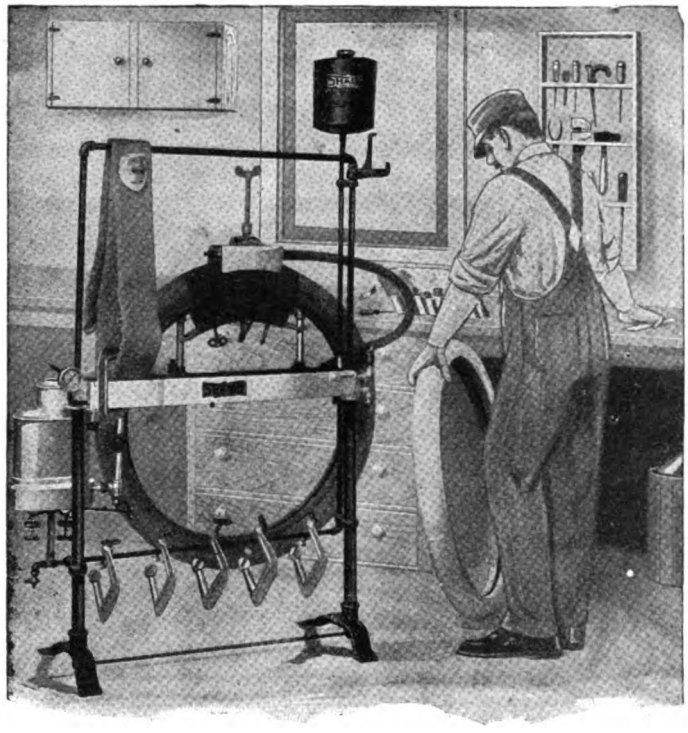
Repair Tires—Make Money

The garage that does not repair or vulcanize tires is losing money every day. Every car owner must have his tires vulcanized. Every storage customer is a vulcanizing customer and drives into your garage every day. You don't need to go outside your own door to get the business.



The motoring season is now opening up. It will soon be at its height. From now on tires will need many repairs very often. Be prepared to get this "extra trade." Install in one corner of your garage a

SHALER Vulcanizing Plant $60 Subject To Trade Discount

The auto owner, when he comes to you for supplies, gasoline, oil, etc., and knows that you can repair his tires, will gladly give you the job.

Exclusive tire repair shops who do nothing but vulcanize tires and make big money by it have no such advantage. They must go after every dollar's worth of business. Your business is entirely different because the car owners drive right into your garage every day. You can keep tab on their tires and remind them when vulcanizing is needed.

Give your customers this complete service they like and be ready to repair their tires.

Simple to Operate

Anybody who can clean or adjust a car can operate a Shaler because of the simplicity of Shaler Wrapped Tread Method and Automatic Heat Control.

The Shaler Wrapped Tread Method

The Shaler System has been used successfully by tire makers for many years.
The repair is built up on the inside of the tire without cutting away any good rubber or fabric.
The repair is heated from the inside and outside at the same time so that it cures very quickly.
Less repair material is needed than with any other method.
No airbags are necessary.
All sizes of tires are mended without moulds or extra fixtures.
The tire is not disfigured as by sectional repairs.
The repair is as strong as the rest of the tire.

Automatic Temperature Control

This is an exclusive Shaler feature that keeps the temperature of the vulcanizer exactly at the right point from morning till night without any watching or regulating.
The vulcanizer can't possibly overheat a tire, the operator can use all of his time in preparing repairs because the vulcanizer doesn't need to be watched.

Send the Coupon—Make More Money

You can easily add up to $25 a day to your revenue repairing tires with a Shaler Vulcanizing Plant. Send coupon at once for full details—the low discount price and our book for garages only—"Common Sense About Tire Repairs."

To Accessory Dealers 70 per cent of all the vulcanizers in use are Shaler Vulcanizers. Sell the best—the one that gives the best results. Write for offer.

MONARCH
Spark Plugs

Announcement

1916 will be the biggest year in our history.

We are going to hammer our story into the minds of the Mighty Millions. We are going to create a demand for our products by the biggest advertising campaign ever attempted by any Spark Plug Manufacturer. We are going to let every car owner know that MONARCH SPARK PLUGS are on the map.

We will fire our first advertising shot in a very short time. The boom of our guns will be heard everywhere and by everyone.

You, Mr. Dealer, are going to be directly in line for your share of the business that will be created by our advertising. Write us today for details regarding this proposition. It's a real money maker, and you can't afford to overlook it.

At Our Expense. Every GARAGE, PUBLIC or PRIVATE, needs this BIG, STRONG, COMBINATION OF TOOLS called the

STEWART HANDY WORKER

Weighs Boxed 90 Pounds

Price Complete Only $12.50

If you bought all the tools you get with it, of the same high quality, strength and durability, and the equipment to operate them, they would cost you at least $25 at wholesale price.

A complete, compact workshop that you can attach to a table or bench anywhere about the garage and make it pay you big profits.

NOTE WHAT IT INCLUDES

A strong, practical anvil; powerful vise, up to 4½ inches, width of jaw 4 inches; a sure-grip steel pipe vise, takes up to 1½ inch pipe; a Corundum grinding wheel, 5 inches x 1 inch; a two speed drill press with 2 drills; a metal cutting wedge and driving mechanism of three speeds—direct, 4 to 1 and 16 to 1—easily regulated by changing the handle grip. It operates grinding wheel, buffing wheel and many other similar tools. With the Stewart "Handy Worker" you can do much of your own car repairing, etc., blacksmith work, home repairing, make plumbing repairs, keep knives and other cutting tools sharp and in good working trim.

READ OUR SPECIAL OFFER

Send for one of these great combined outfits today with the understanding that if you don't like it in every way you can ship it back and we will return every cent you paid out. Of all the thousands shipped, not one customer has made a single complaint. It pleases every customer, but our standing offer to return every cent paid out holds good to each purchaser.

SEND ONLY $2.00 WITH YOUR ORDER and pay the balance when it arrives. ORDER TODAY OR WRITE FOR BOOKLET.

THIS IS YOUR TROUBLE

WASTED FUEL
LOST ENERGY
PISTON SLAP

When your motor is worn or cylinders scored the explosive pressure will escape down between the sides of the piston and cylinder walls and the fuel used to produce this energy is lost. This condition of your motor causes a waste of fuel, which necessarily increases the cost of operation and causes that misery of nerve-racking noise.

With your cylinders reground and new pistons and rings fitted, your motor will run like new, will have more power, smoother and quieter running. Where the cylinders are scored, we puddle in molten iron and thus retain the original strength of the cylinder walls.

We specialize in this work and have the most modern and complete equipment in the country. This work is done by skilled engine mechanics. Satisfaction is absolutely assured.

AUTO MACHINE WORK, wrist-pins, gears, crank shafts, bushings and valves.

Don't delay—ship your cylinders, or write us.

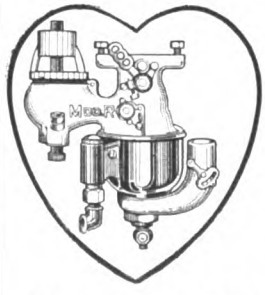
KENNEDY AUTO STORAGE COVERS

To meet the need of an inexpensive and efficient cover for automobiles while in dead storage we are making a paper cover, which is proving the right thing for this purpose.

These covers are made of strong heavy paper, properly reinforced to prevent tearing.

They protect the car against dirt, dust and moisture and will prevent the polished portions from tarnishing and the finish from checking in cold weather.



These covers are salable to individual car owners at a good profit as well as to furnish the dealer a protection for his stock of new cars.

We make them in four sizes: 7 PASSENGER, 5 PASSENGER, FORD SPECIAL, ELECTRIC.

Winter will soon be here and dealers can handle these covers with satisfaction and profit. Further information on request.

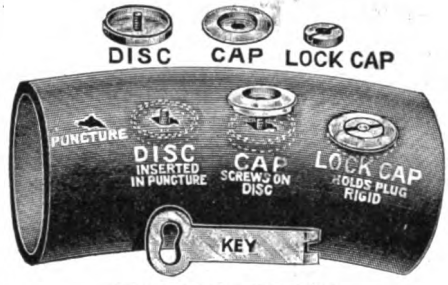
SPITLER PUNCTURE PLUGS

The Spitler Puncture Plug repairs punctures in automobile inner tubes quickly and without the use of cement, assuring a safe, permanent and economical repair.



The operation is so simple that a lady can make the repair without soiling her hands.

The plug can easily be taken out and used over again. A permanent repair in one minute.

To insert The Spitler Puncture Plug into the puncture, wet the tube before inserting plug.

Place the base of plug on edge and by stretching the tube at point of puncture, the plug slides in like a button in your coat. Then place cap over discs and screw lock cap firmly.

The Spitler Puncture Plug positively cannot cut the tube nor injure the fabric of the shoe for the principle is the same as the air valve on the tube.

Write for Circular.

Price—Four to a Set, $1.00.

(Patented May 11th, 1915.)

SPITLER PUNCTURE PLUG CO., Inc., United States Rubber Building, 1790 Broadway, NEW YORK CITY

Oil on the roadway usually indicates packing that doesn't pack

Any packing in transmission, differential or crank cases that is destroyed by oil, grease, gasoline, hot or cold water is unsuitable for the service, and is sure to not only cause constant trouble, but is also expensive and wasteful of both lubricants and parts lubricated.

Endura Sheet Packing is made especially and only for oil, grease, gasoline, hot and cold water connections, and therefore always assures the user of tight joints in just the places where ordinary packing must fail.

We will gladly mail you free samples and a chart, "How to Pack the Car," if you'll send the coupon.

Oxy-Acetylene Welding and Cutting

Showing the Variety of Work Handled and Simplicity of Apparatus.

Are You Sharing in These Enormous Profits?

Garages, repair shops, and metal working establishments everywhere are finding that in practically every instance where two pieces of metal are to be joined, Oxy-Acetylene welding does the work better, quicker and cheaper than any other process.

Many automobile manufacturers find this method immensely profitable in simplifying the manufacture of intricate metal parts, increasing production and improving quality. Garages are saving the cost of welding equipment many times over by being able to make instant repairs in their own shops.

Any workman of average intelligence can learn to do this work easily and efficiently. We train operators free of charge.

Necessary welding apparatus is very simple and inexpensive. We furnish a thoroughly high grade outfit for $60; (Canada, $75); Acetylene service at additional cost. Adaptable for Oxy-Acetylene cutting with addition of special cutting apparatus.

Prest-O-Lite PROCESS

Employs Prest-O-Light Dissolved Acetylene (ready-made gas) in portable cylinders—backed by Prest-O-Lite Service. Used as conveniently as cylinders of oxygen. Saves large initial outlay and heavy depreciation of making crude acetylene in carbide generators. Perfectly dried, cleaned and purified—makes better welds and is cheaper to use.

START NOW—GET FULL DETAILS

The demand for Oxy-Acetylene Welding Repair work is large and growing. Get your share of the profits. Send for literature that shows how you can apply Oxy-Acetylene welding in your shop, with profits to you and savings for your customers.

792 7th Avenue **New York City**

The Foundation of this Tire

is just as good as the day it was bought. Any tire with good fabric, whether there is any rubber on the outside or not, is suitable for the

TRIPLE TREAD PROCESS

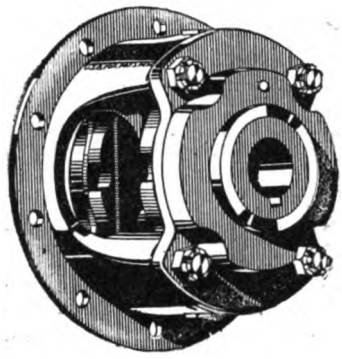
The Triple Tread is the only tire protector made

that does not depend on inflation, rim pressure or mechanical means to hold it in place, so that the style of bead on your tires cannot affect the success of their treatment.

In Vulcanizing the Triple Tread on your Tire

we are able to fill the pores of the leather with rubber, making it waterproof, so that by bringing the leather down the sides and over the bead of the case, covering it completely, we are able to keep dirt and water from getting under the tread to rot the fabric, and also to strengthen the sides and bead of the tire.

Write for our booklet,



"Worn Out Tires Made New."

Please mention the size of your tires.

STOP!

Skidding—
Slipping—
Sliding—
Laugh at bad roads

The Bailey Gearless Differential

Power is always delivered to the wheel having traction—the loose wheel doesn't spin around, "sand-papering" the tire. You can pull through slush and mud and sand with ease.

The positive drive to both rear wheels insures you against skidding, slipping or sidesway. Thousands of owners say it adds fifty per cent to safety and comfort.

Ford, Overland and Chevrolet Replacements Now Ready

Owners are quick to see and purchase the Bailey Gearless Differential—our sales have increased five-fold in a few months.

Every sale is on a guaranty of satisfaction or money back in 30 days.

Write for circular and plan of dealer co-operation. The Bailey Gearless Differential is a big thing for the dealer, and getting bigger all the time.

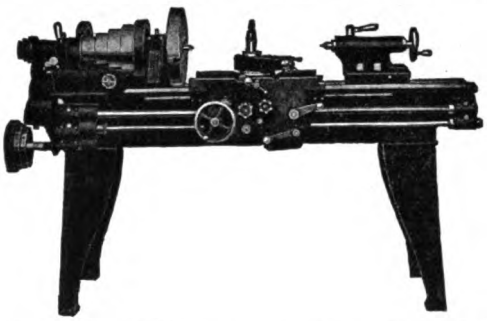
Add $250.00 A MONTH EXTRA To Your Business

REPAIR AUTOMOBILE TIRES

Sounds like a whole lot of money to clear extra every month. Seems almost impossible, but that is what hundreds of men are doing who have added a Tire Repair Department to their business. **The investment is small, the profit large** and **returns quick and all cash,** besides the demand for tire repairing and retreading is constantly growing. Your garage is by no means complete, your business is not as profitable as it can be until you get in on the Tire Repairing and Vulcanizing end.

THE HAYWOOD TIRE REPAIR EQUIPMENT



Answers all the requirements to successfully handle this end of the business. With it and a little business judgment, success is certain. Every year adds thousands of new auto owners. They are looking more and more to economical tire service. The day of discarded tires is over, the Haywood Equipment makes this possible.

HERE IS YOUR OPPORTUNITY

Either as a side line to your present automobile business or as a business by itself, the Haywood Equipment will make money for you. **Tires go wrong all the time.** You know that. Keep them in tune. Give your customers complete service—repair their tires and all. This builds business and makes you rich. Experience unnecessary. You can learn easy—or teach a boy to handle this end. Be the boss and make the money. Learn the details now. Investigate. Act quick. Be the first. Send name and address only. A postal will do.

For Leaky Cylinders

Superior to All Others

PATENTED AUGUST 6, 1912

A Piston Ring Which Gives Compression in "Out-of-Round" Cylinders as Perfectly as in True Ones

Beware the "Just as Good"

Here is a piston ring that gives 100% efficiency to every type of motor, engine, compressor or pump.

Ideally adapted to use in Automobile and Motorboat engines.

Gives compression when all others fail. No need to rebore worn cylinders—simply install EVER-TIGHT piston rings and the motor is good as new.

EVER-TIGHT piston rings are made up of three individual, interlocking rings, grooved together to give flexibility and reduce friction. This three-part construction is clearly seen in illustrations above. This is the only perfect three-piece piston ring on the market.

If dealers do not carry EVER-TIGHT piston rings, Auto repair men should write us.

Jobbers and dealers wanted everywhere. *Write for particulars.*

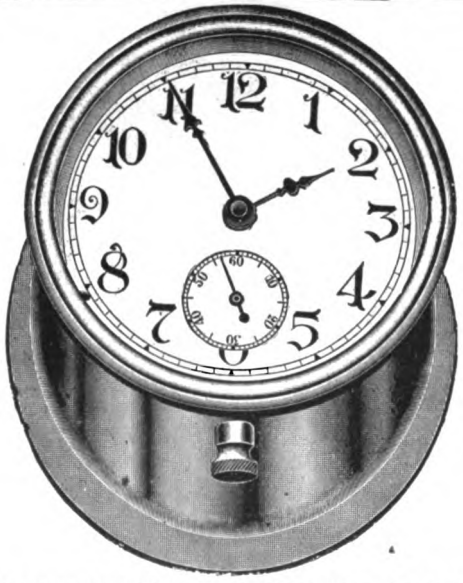
HEISER'S IMPROVED CYLINDER REBORING TOOL FOR FORD ENGINES

REPAIRMAN



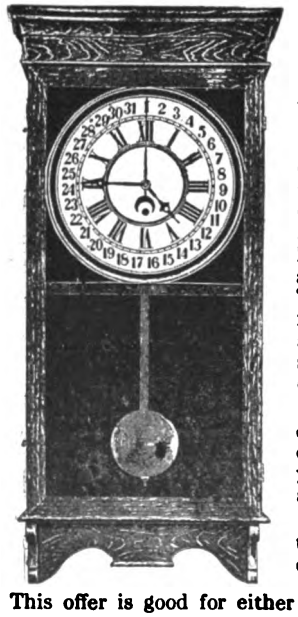
There has been a period in your life that you were unable to tell a valve from a spark plug, a magneto from a carburetor, or a cylinder from a piston; some one had to tell you what these parts were and their function. The troubles arising from these and other parts of a car, you have mastered, but you are still at sea if you do not understand and are not prepared to rebore and fit oversize pistons, for this is the most important repair that can be given a worn engine.

The HEISER IMPROVED CYLINDER REBORING TOOL for Ford Engines, makes a good shop out of a poor one and a better shop out a good one, but best of all, it gives the owner service. The end of this season will see one million Fords on the highways; this means many million dollars will be spent on reboring and fitting oversize pistons.

The early bird catches the worm. We furnish oversize pistons to fit the rebored cylinder, $1.50 each, Complete.

Write for further particulars about this wonderful tool.

HEISER SPECIAL TOOL CO., (Dept. A) KINGSTON, MO.



DO YOU WANT A MOTOR CLOCK

For your car, and a good one? The clock illustrated in this connection is manufactured by one of the most reliable clock companies in the country and is warranted in every respect. It is not liable to get out of order. It has interchangeable parts. It is the product of skilled labor combined with the most improved Waltham Automatic Machines. This clock is 3¾ inches high, and has a Porcelain dial 2½ inches in diameter. It has a one day movement with second hand. It can be furnished in burnished brass or nickel plated whichever is preferred. The arrangement we have made enables us to furnish **one of these clocks and a subscription to the Automobile Dealer and Repairer for a year** to all residents of the United States and its territories for the precise price the clock retails for, namely, **$2.50.** If an eight day clock is preferred send 50 cents extra or $3.00. Canadian subscribers should add 50 cents extra to cover the extra postage required on the **Automobile Dealer and Repairer.** This clock cannot be sent to foreign countries. The clock can safely be sent by mail and will be forwarded postage prepaid to any part of the country. Remittances can be made in any convenient way. Address

MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, - - - - New York, N. Y.

Every Repair Shop or Garage SHOULD HAVE A CLOCK.

We have recently made very favorable arrangements with one of the largest clock companies in this country by which we are enabled to offer to our readers in the United States or its territories a Regulator Eight Day Calendar Clock 38½ inches high, with a 12 inch dial, finished in Oak or hand-rubbed Mahogany, with a subscription to the Automobile Dealer and Repairer for one year, at the very low rate of $3.00. This clock cannot be sent to any foreign country except Canada, and Canadian subscribers must send 50 cents more to cover extra postage on the paper.

Every repair shop, garage or dealer's office should have one of these clocks. It will give you the time of day correctly and the day of the month.

The engraving shown gives the correct appearance of this clock.

This offer is good for either old or new subscribers.

Remittances can be made in any convenient way. Be sure to state whether you want this clock in Oak or Hand-Rubbed Mahogany.

5 YEAR GUARANTY

Ford

owners stop the Big Noise

By Making Your Car as Quiet as an Electric and as

Sturdy as a Truck for Heavy Duty

DOTTED LINE shows the teeter and buckle as you step on your car now.
SOLID LINE shows how rigid CASEY braces are guaranteed to make it.

The strongest chain is limited by the strength of its weakest link. The weakest link in your Ford car is the step boards.

If you doubt this just step on your own Ford as a test and you will positively prove that the dotted lines here shown are not exaggerated but taken from an actual demonstration.

The solid lines in drawing clearly illustrate the most practical design for rigidity and strength, which follows the trusty principle of three point structural steel trussing as used in Bridge building and other permanent construction.

Two dollars, invested in a set of Casey Step Braces are not alone the first and only cost, but that they will positively support your Step Boards and Chassis as illustrated, besides eliminating this rattling from your Car during its entire life, we guarantee absolutely.

Any time you prefer to go back to the destructive Teeter Board, we will pay all transportation expenses and give you your Money Back, without a question.

Anyone can easily attach the Casey Step Braces in a very few minutes. No drilling or fitting necessary. All you need is a wrench. Shipping weight 4 pounds. Casey Step Braces complete, per pair..... **$2.00**

Our letter files have thousands of letters from pleased customers expressing exceptional satisfaction and service:

JENNINGS MOTOR CAR CO., JENNINGS, S. D., writes: "Express us at once twelve more sets of Casey Step Board Braces. We find them one of the very best things for Fords that have been put on the market."

H. W. GILL, PORTAL, N. D., writes: "Parcel post me two sets of Casey Step Board Braces, one I am ordering for a friend. Please thank 'Casey' for this valuable tip, and also the AUTOLOG."

J. M. MUILENBURG, HURLEY, S. D., writes: "I would not take **$10.00** for my Casey Step Board Braces if I could not buy another set. They are worth more than ten dollars to any Ford user. I particularly show them to all my Ford friends, realizing how 'Casey' won my eternal gratitude, in giving my own car a more enduring and noiseless foundation for heavier service."

CASEY ASCO MANUFACTURING CO., 1500 Grand Ave., KANSAS CITY, MO.

Buy Direct and Save Money

GIANT NON-SKID TIRES

Every GIANT is a high grade tire of standard make, selected from the companies' own salvage stocks, and rebuilt to extra strength and with our heavy non-skid tread added.

Tread and body are vulcanized into one strong unit in *live steam*, making a tire the same as a new standard make in quality and appearance, but frequently giving many thousands of miles more service.

Our unequalled facilities for buying in large lots, and strengthening these tires, enables us to quote you for direct sale, the following

EXTREMELY LOW PRICES

	Non-Skid	Smooth	Tube		Non-Skid	Tube
30x3	$ 6.60	$5.95	$2.10	36x4	$13.25	$3.90
30x3½	8.50	7.95	2.65	34x4½	15.50	4.60
32x3½	9.80	.....	2.80	35x4½	16.10	4.75
33x4	12.30	.....	3.55	36x4½	17.05	4.85
34x4	12.60	.....	3.70	37x5	20.75	5.80

5% Discount on orders for two or more tires or tubes. Send $1.00 for each tire or tube, cash with order; balance C. O. D., with privilege of examination.

Prices on application for Limousine Tops for Cadillac, Studebaker, Overland, Reo, Dodge, Maxwell, Buick, Hudson and Chalmers cars.

WADSWORTH MANUFACTURING CO.
1309 Jefferson Avenue Detroit, Michigan

How to Become an Expert Automobile Mechanician

The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical simplified instruction on everything you OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine; from the construction of different type axles to the sleeve and rotary valve type of engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. For instance, under the subject of storage batteries you learn how to test a storage battery with a hydrometer instead of a pair of pliers.

Step by step you advance until you are a real expert on timing the valves and ignition. You learn the carburetion subject so thoroughly, you can adjust any make.

Delco, Ward Leonard, Entz, Westinghouse and all electric starting systems will be clear in your mind.

It is chucked full of just the things you OUGHT to know and want to know. There are over one thousand seven hundred and fifty illustrations—simplified illustrations, which, in most instances, explain without the use of the text.

As stated above, the illustrations are SIMPLIFIED; take for instance the illustration of the Atwater-Kent Ignition System, the illustrations show in detail all the INSIDE parts, and just how the coil is wound, how the depolarizing switch operates and why it is necessary—in other words, all detail usually omitted by others is included.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

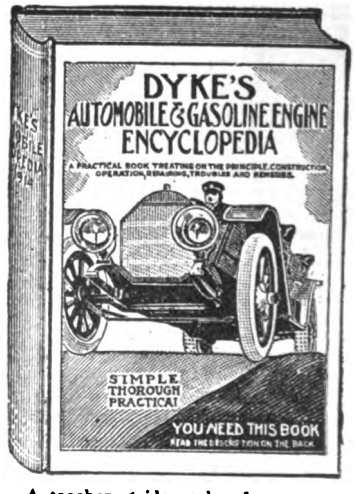
DYKE'S AUTOMOBILE and Gasoline Engine ENCYCLOPEDIA

REVISED, ENLARGED, FOURTH EDITION NOW READY

Price $3.25, Prepaid

THE LATE EDITION AT LEAST ONE HUNDRED PER CENT BETTER . . .

A Complete Ford Instruction



added—as well as many other subjects. Some of the new subjects added are; **Electric Starters, Generating and Lighting** Systems, up to date.

How to Time Valves and Ignition—simplified so a ten-year-old boy can understand.

Six, Eight and Twelve Cylinder Engines; every detail from construction to firing order—simplified.

The Repair Subject—greatly improved and many new illustrations added. This subject improved at least a hundred per cent.

Complete Digest of Troubles which will make an expert of you—one capable of diagnosing troubles, scientifically—by a process of elimination—many other subjects added—such as trucks, tractors, etc.

A teacher, guide and reference on everything pertaining to motoring. Simple as the a, b, c's.

It's worth ten times its cost if only placed on the shelf and used as a reference when you are stuck.

Last edition, 1,000 illustrations, 596 pages. This new fourth edition, 1,750 illustrations and 640 pages.

Over one hundred thousand DYKE books sold, not one returned.

BIFF! BANG! BUMP!

No human being could stand the thumping a tire gets on any road. Sometimes the tires don't stand it either. They get injured, fractured internally. Inside the tire a weakness develops, and next thing the tire is ready for the junk heap, and some trip has been spoiled for you.

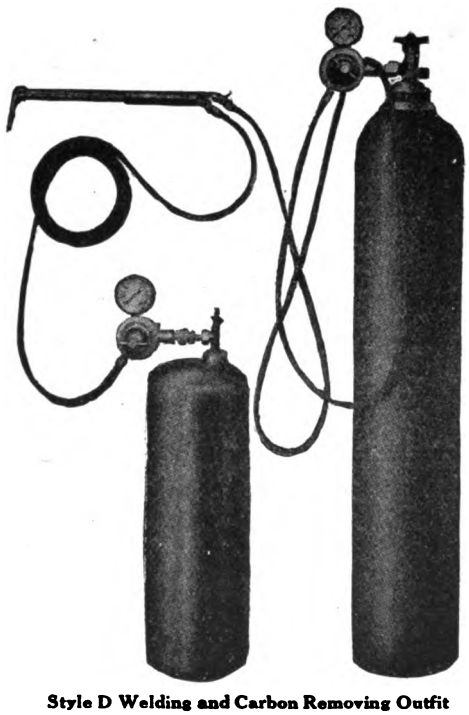
INVINCIBLE INNER TIRES

Strengthen the inside, where the blow-outs always start, and by their reserve strength prevents them so that your tires deliver every mile there is in them.

You should know what **INVINCIBLES** will do for you, what they cost—how they save 40% of tire expense and 90% of tire trouble—how tires which have run three or four thousand miles can be made to do as much more.

Write us today for 1916 prices (20% lower), big user's letters and a FREE set of tire record cards, and our trial offer.

SAVE 40%



INVINCIBLE TIRE COMPANY, 53 Sabin St., Providence, R. I.

The ALLEN TIRE CASE

WHEN an unused spare shoe which you have been carrying around for six months (or three months, as the case may be) EXPOSED to all the elements, is finally put to work, and then unexpectedly "blows"—don't blame the unfortunate shoe. You could have saved it yourself with the Allen Tire Case, the perfect protection for spare shoes. It's the real "SAFETY FIRST" for service from spare shoes, and again,—just remember that when you need a spare shoe you need it badly. Moral!—Put Allen Tire Cases on your spare shoes now! $3.00 and up at your dealer's, or from the manufacturer. Booklet on request. To test the air pressure in your tires there's nothing "just as good" as the $1.00 handy, accurate

The NISWANDER TIRE RIM REMOVER

The tool described here does away with all your troubles in changing the rim in your automobile tires. With it, you can change a tire rim within two minutes, which expands the rim as well as contracts it and the spring hooks are so arranged, that the harder the pull the tighter they grip the rim, in either operation. In the cuts shown will be noted Fig. 1, the tool in the act of contracting the rim; Fig. 2, in the act of expanding and forcing the rim in place in the tire: Fig. 3 shows the tool folded to a length of ten inches, and as the weight is but two and one-half pounds, can be carried in coat pocket. We guarantee the tool to work successfully on any rim regardless of make or size. Can be purchased from any dealer at three dollars, but if your dealer does not have them, we will on receipt of three dollars mail you one by prepaid parcel post.

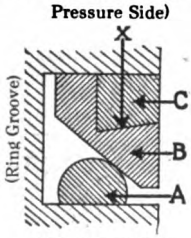
Manufactured by AUTOMOBILE APPAREL CO., Port Chester, N. Y.



Pressure Proof Piston Rings

stop oil troubles because they take up side wear in piston grooves by means of the spring expander acting on the bevel on the under side of the ring. This feature appears in no other piston ring.

They are made of soft cast iron, no steel or composition to score cylinders.

Ever see a piston ring that would give perfect service after being broken?

(Section of Ring)

The Pressure Proof is the only ring that will do this. Let us tell you how.

The Pressure Proof Ring will give longer service and higher efficiency than any other ring made, regardless of price or construction.

See us at the New York Show, Space D–89.

Write now for particulars and dealers' proposition.

SMITH'S NON-SKID CANVAS TREAD TIRE construction guaranteed for 5000 miles but average is 10,000 miles. Two strips of rubberized canvas projecting from the inside of the tread to the outside, makes this tread non-skid all the way through, and also acts as a radiator, preventing the tread from heating, peeling off. Also prevents stone bruises, punctures and blow-outs. It draws easier than tires with knobs on the tread and saves 25% in gasoline. **Free booklet describing other important features and agent's proposition.**

SMITH'S CANVAS TREAD TIRE CO.

HASSLER

Shock Absorbers for Ford Cars $15 for a set of FOUR

Messrs. Robert H.Hassler, Inc.,
Indianapolis, Ind.
U.S.A.

Gentlemen,-

I have your Shock Absorbers on my Ford car, and in four days drove about 875 miles over all kinds of roads. I can only say that I did not know it would be possible for shock absorbers to make so much improvement in the running of a car. We drove at from 20 to 30 miles an hour over roads, which without the shock absorbers would have made it necessary to slow down to 10 or 15 miles an hour.

Please let me know your terms to agents as I believe you have none in this territory.

Yours very truly,

MP/CK

We leave it to your judgment. Would users write us letters like this if the Hassler didn't satisfy them in every way? You buy Hasslers under guarantee of money returned if you can spare them after you have once tried them.

DEALERS:

Don't overlook the best bet in the Ford equipment field. Let us send you a trial set. Not sold through jobbers—we protect you.

ROBERT H. HASSLER, Inc., Indianapolis, Ind.

We Now Present The Record-Breaking Hudson Super-Six

HUDSON SUPER SIX TRADE NAME REG.

$1375 at Detroit

Patented by Hudson December 28, 1915

Officially Breaking All Stock Car Records up to 100 Miles. Also All Stock Car Records for Quick Acceleration—Under A.A.A. Supervision

100 miles in 80 minutes, 21.4 seconds, averaging 74.67 miles per hour, with driver and passenger.
The previous best record of 72.49 was made by a car with more cylinders, more cylinder capacity and driver only.

75.69 miles in one hour with driver and passenger.
During this trial speed laps were made at 76.75 miles per hour.

70.74 miles in one hour, carrying 5 passengers, with top and windshield up.
The previous best record for stock car similarly equipped was made by a car with more cylinders, more cylinder capacity, and with only two passengers.

From standing start to 50 miles an hour in 16.2 seconds. This 7-passenger stock touring car was driven 1350 miles at speed exceeding 70 miles an hour without discoverable wear on any part.

All the above Hudson records were made with the same stock car, using the same motor, at Sheepshead Bay Speedway in November, under American Automobile Association supervision.

The most powerful motor per cubic inch displacement which the world has known.

We now bring out a motor which has proved itself the greatest in the world.

It has broken—as detailed above—all the worth-while stock car records.

It excels the best of former Sixes by 80 per cent in efficiency.

It has outrivaled Eights and Twelves, erasing all existing reasons for the V-Type motor.

And this marvel motor, which has proved such supremacy, is a Hudson invention, controlled by Hudson patents.

BETTER BY 80 PER CENT

The motor size is identical with our former Light Six. And that, until now, has been the dominant Six. In two years it quadrupled Hudson production.

The best previous Six of like type developed but 42 horsepower. The Super-Six, in same size, develops 76 horsepower.

That enormous increase of 80 per cent is due solely to ending vibration.

THINK OF 76 HORSEPOWER

Think of 76 horsepower from a Six, with cylinders 3½x5.

No extra size or cylinders. No added complications. No forfeiture of simplicity, lightness or economy. And yet almost doubled efficiency.

It means vast reserve power. It means quick response. It means high gear for all speeds, and for nearly all hills. It means matchless flexibility.

And it comes through ending vibration. So it means utter smoothness at any speed. It means flowing power, bird-like motion.

It means all these things in a degree never attained before.

A NEW EMPIRE FOR US

This means a new empire for Hudson.

Any man who wants the superlative car must now buy a Hudson to get it.

Other Sixes must yield to a Six nearly twice as efficient. And no Eight or Twelve can compete with it.

It also means long engine wear. It means minimum fuel consumption. So it makes the Super-Six an economy as compared with many lower-priced cars.

To meet this demand we have doubled our factory at a cost of $1,500,000. And we have bought materials for $42,000,000 worth of Super-Sixes for the coming season.

We have also built superfine bodies—six new styles of luxury cars. So the Super-Six looks its supremacy.

This car will dominate the fine car field this year. No man who knows can doubt it.

7-Passenger Phaeton, $1,375 at Detroit
Five Other Styles of Bodies

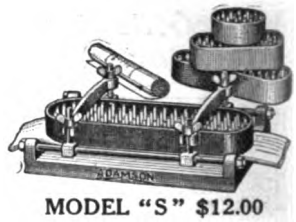
A Million New Customers for 1916

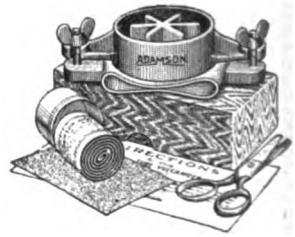
PRACTICALLY every one of the million new cars predicted for 1916 will go into commission without any equipment for repairing tires. Every one of these owners immediately becomes a prospective buyer for that all-important necessity, an "Adamson" vulcanizer.

OVER a million "Adamsons" already in successful use—**more than all other makes combined**—have created a big army of "boosters" and paved the way for immense sales this year.

Get Ready to Sell Them



the vulcanizer that is **most reasonable** in price, **quickest and surest** in operation, and the **easiest** to sell—



MODEL "U" $3.00
For all casings and tubes

ADAMSON
VULCANIZERS

Complete Line for Car Owners and Garages

MODEL "S" $12.00
For private garages and repair shops

MODEL "M" $1.50
For tubes 3½ in. and under

Repairs Instantly

by the roadside or wherever you are, and removes the temptation to run on a flat tire. Repairs and seals up cuts and minor tread injuries before they grow larger and cause blow-outs. No steam or electricity—no skill required—the "Adamson" uses common gasoline and is **automatic.**

REPAIR GUM
No cement is required

MODEL "T" $2.00
For all sizes of inner tubes

Write for Catalog

on complete line for car owner and garage use, also copy of latest booklet, "Repair and Care of Tires."

DEALERS: Get Our 1916 Proposition.

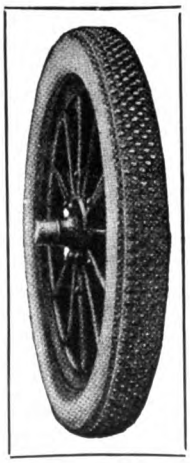
ADAMSON MANUFACTURING CO.
EAST PALESTINE, OHIO

Digitized by Google

This photograph, taken in a typical junk shop, shows only one corner of ONE ***of the thousands of junk shops*** located in every nook and corner of this country.

Junkmen buy thousands of cast-off tires every year—tires that have been THROWN AWAY simply because they were tread worn or rut worn—***an enormous waste***—and all they pay for them is about 3c. or 4c. a pound. A ridiculous price when you consider that nearly every one of these tires was good for at least ***5,000 miles more service*** if the owners had done what European motorists have been doing for the last four years.

What European Motorists Do



For the last three years European motorists have been getting from 10,000 to 15,000 miles out of a set of ordinary rubber tires instead of being satisfied with 1,000 to 3,000 as American Motorists are—they get this mileage by ***half-soling their tires with Steel Studded Treads*** and in the last eight months over 30,000 American Motorists have followed their example and cut their tire costs nearly in half.

Save $50.00 to $200.00 a Year

The almost unbelievable waste in tires by the American Motorist is not only national—***it is vitally personal.*** It affects ***you—your pocketbook.*** Just consider what it would mean to you to get 10,000, 12,000 or 15,000 miles out of your rubber casings—and without the constant dread of tire trouble, saving enough to nearly pay your yearly gas and oil bills.

Guaranteed 5,000 Miles Without A Puncture

This fact appeals to many motorists far more than the amount of money saved. The constant dread of punctures and blow-outs spoils the joy of motoring—each unnecessary noise, each bump or "pop," makes the motorist think of tire trouble FIRST. Durable Treads are backed by our signed guarantee—***as good as a government bond***—for 5,000 miles of wear without a puncture. Think of the joy of motoring when you know your tires are protected against the roughest roads, and ***can't be punctured.***

No More Skidding

Durable Treads are as sure-footed as a Rocky Mountain Burro—look at the photograph—the sharp edges of the steel studs will grip the ***slipperiest road*** and make skidding almost an impossibility. With Durable Treads on your tires you receive perfect non-skid service while your tires are ***protected instead of injured,*** and you never have to get out in the mud and put on chains.

We Deliver Free

Without a cent deposit—prepay the express and allow you to be the judge. Remember that Durable Treads are gripped tightly by the rim, just the same as the tire—water and sand proof—and easily applied in your own garage in thirty minutes without special tools.

Special Discount

We offer a special discount to motorists in new territory where Durable Treads have not yet been introduced. The sales of Durable Treads (the only practical tread) increased 917% in the United States alone during the past year—over 40% of these sales were unsolicited—made through the recommendations of other Durable Tread users. Tear off the coupon ***right now***—and mail it at once. Don't run your tires barefooted another day—find out how to get at least 5,000 miles more out of your tires—***mail the coupon.***

Right on the Crank-shaft

In front of the radiator—in the one place where the electric starter has *got* to be to give satisfactory service on a Ford car.

EVEREADY

Front-of-the-Car Direct-Coupled

Starting & Lighting System for Ford Cars

is placed directly on the center line of the car and drives direct on the crank-shaft.

This epoch-making system embodies advantages which are absolutely impossible with starters placed under the hood and connected by chain drive which exerts a side pull on the crank shaft, causing undue wear on the bearings.

It does not disturb the 3-point suspension of the car.

Acting as a second flywheel it eliminates vibration and keeps the car to the road.

It runs at engine speed and instead of acting as a drag on the motor actually increases the flexibility of the car to such a degree that you can throttle down to three miles an hour on high.

It is equipped with the EVEREADY Non-Sulphating Storage Battery—the only battery guaranteed against sulphation, the most common cause of battery trouble.

It can be attached in a few hours without removing any parts or making any changes in the engine or car.

There is no other starter of which you can say as much. When you get a starting and lighting system for *your* Ford be sure it's direct-coupled and located *in front of the car.* In other words be sure it's EVEREADY.

RIDING COMFORT WITH CANTILEVER SPRINGS

When roads grow rough, the activity of the cantilever type of spring requires the effective control of the

Shown at the Auto Shows

*Hartford SHOCK ABSORBER

Shown at the Auto Shows

Cantilever Spring and Hartford Shock Absorber

to insure riding comfort. Dissipation of the surplus energy, by frictional absorption, perfects the function of this type of spring in particular, noticeably improving the traction of the car, absorbing all the small but disagreeable vibrations, and promoting practically perfect results in the riding qualities of the car.

Attachment is simple. The above illustration shows the relative positions of the spring and shock absorber and suggests the harmonious operation of both.

If your car has cantilever springs or other active springs, it needs the Hartford Shock Absorber in order to carry its load with comfort over every road.

You Can Leave the Switch On

Even after Stopping Your Motor if equipped with

Atwater Kent Ignition

Did you ever put up your car after an evening spin and go peacefully to bed and—sometime in the stilly watches of the night—pop wide awake and say:—

"There! By George, I left that ignition switch on! That's the second time I've forgotten it, and the last time the battery had to be removed from the car and overhauled. The starting crank for mine in the morning!"

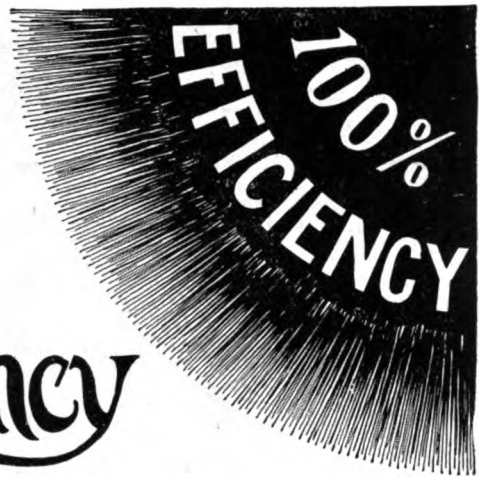
That little "I wonder" imp can never disturb your mind if you use Atwater Kent Ignition. One of the features of this system is that it *cannot stop* with the contact points touching, no matter in what position the engine may come to rest.

The action of the Atwater Kent contact-maker is similar to the shutter of a camera, which, once released, must finish its work by *opening and then shutting*. So the Atwater Kent contact-maker must finish its work by first making, *then breaking* contact.

No automatic protective device is needed to safeguard the battery or wiring and except for stopping the motor the ignition switch may be forgotten. Current is consumed only when the engine is running and then only during the exceedingly *brief instant* of the spark.

This is but one of many big advantages obtainable only in Atwater Kent Ignition. An absolutely uniform intensely hot spark from cranking to racing speeds—easier and safer starting—greater power at low speeds—increased flexibility and ability to drive the car with the throttle alone—no necessity for touching the spark lever—all these and many other features are found in this system alone.

Specify Atwater Kent on the car in which *you* are interested. Write us for data.



See us at the auto shows—New York, Space C-38—Chicago, Coliseum Gallery, Number 22.

Chicago Show—Booths 159 to 161
(Coliseum Annex, Accessories Section)

WEAVER AUTO TWIN JACKS

Combine all the service of Turn Table—Lifting Jacks—Transport—and Tire Rests. Ball and Roller bearing—strongly constructed—convenient to operate.

Made in two sizes. Capacity 4,000 and 8,000 lbs.

Price, Set (Two) $20.00 and $36.00

WEAVER AUTO AMBULANCE

A scientifically designed truck for towing in disabled cars. Enables one man to do the work of three.

Roller Bearing Cast Steel Wheels — Telescoping Tongue—attaches to either axle of the car.

List Price, $30.00

WEAVER GARAGE PRESS

20 Ton Capacity

This Press will save two-thirds of your shop labor and enable you to make a satisfactory profit on your repair work.

CONSTRUCTION

The frame is one piece of heavy channel steel—hand wheel is 15 inches in diameter—carried upon ball bearings—width between frame 32 inches—height of frame 74 inches—floor space 36x36 inches — weight crated for shipment, 450 lbs.

Net Price, $48.00

WEAVER VALVELESS BUCKET PUMP

Capacity 25 lbs.

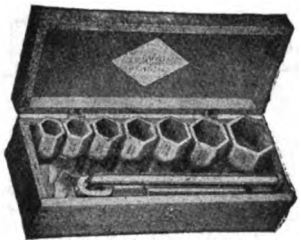
One great advantage of the Weaver Bucket-Pump is the fact that our valveless construction permits lubricants to be handled in "three ways."

FIRST—The lubricant can be forced out of the Bucket and into the desired receptacle. SECOND—Grease or oils can be sucked out of the differential, transmission, housing, etc. THIRD—The barrel or chamber of the Bucket may be sucked full of foreign lubricant and discharged again through the hose into a third receptacle without disturbing the contents of the Bucket.

SELF-MEASURING

The lubricant is measured as delivered.

STEEL HOSE



The Weaver Bucket-Pump is equipped with ¾ inch Flexible Steel Hose which cannot be affected by the grease.

$15 With Regular Kick Switch

$16 With K-W Autolock Switch

K-W Autolock Switch

$3.50 Complete

K-W Road Smoother

$15 Set of Four One for Each Wheel

TRADE K-W MARK

PROTECTION

The name K-W is really a symbol of protection for both the motorist and the dealer.

To The Ford Owner

The K-W Autolock Switch protects your Ford car absolutely against theft or tampering when left in garages or in the street.

The K-W Master Vibrator protects you from the annoyances of poor ignition. It gives you surer and better ignition than high tension magneto—easier starting in cold weather—one adjustment instead of four—more power—a hotter spark—cleaner spark plugs, and all on less gasoline.

K-W Road Smoothers protect you and the parts of your car from the jolts and bumps common to riding over rough, rutty, frozen roads. They smooth out the kicks and worries of the road. Where you ride there are no jolts—no jars. They are so constructed that they absolutely do not interfere with the steering. They prevent side motion and rocking.

Right in your neighborhood you will find a Ford car equipped with a K-W Master Vibrator,—Autolock Switch or Raod Smoothers. Ask the owner what they are doing for him every day. He can tell you better than we of the efficiency, economy, and reliability of K-W products.

K-W products are the Standard of Excellence all over the World. They are sold by dealers who know the difference, everywhere. If yours is out sent prepaid on receipt of price.

To The Dealer

The integrity of the name K-W prohibits exaggerated claims and promises. It is a symbol of fair dealing, as important to you as this mark on K-W apparatus is a guarantee to the user of quality, reliability and service. This broad, square-deal K-W Policy protects you, Mr. Dealer.

The K-W line is a profitable one for live dealers. Write for our liberal sales plan today.

An Automobile Necessity

That should be in every auto kit and will save you many a dollar at garage and repair shops. It will also do away with the carrying of extra wheel or shoe attached to the car.

That Means The End Of Tire Troubles

as it will enable you to fix instantly, while on the road, or in your garage, any puncture or blow-out, from a pin-head to an ugly gash,

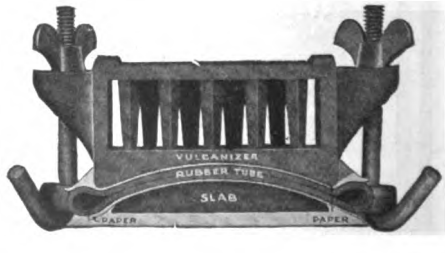
Without A Change Of Wheel Or Tire

or taking the auto to a garage for repairs, that make you dig down deep in your pockets.

The Worcester Automatic Vulcanizer

"Worcester Made"

requires no experience to operate. Every machine is guaranteed, adjusting all tire troubles in the shortest possible time, avoiding all road delays, making permanent repairs in Tube or Shoe, that are lasting, cost little, safe, speedy and strong.



Price $3.50

Money back if not as represented.

CATALOGUE NOW READY

MOSCO

SPECIALTIES

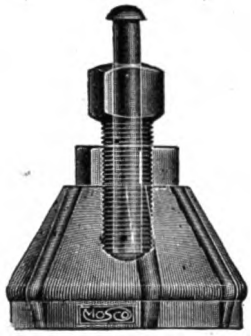
FOR 1916

TIMER SHAFT EXTENSION

Bemus Timer Patents { Sept. 24, 1907 / Dec. 17, 1907 / Feb. 16, 1915 / Apr. 27, 1915 } Others Pending

WHY were tens of thousand of these Timers sold in 1915? Why were we able to obtain a national distribution in a phenomenally short time? Why did 1,000 dealers from Boston to San Francisco look to us exclusively in 1915 for Timers for Ford Cars? **BECAUSE**

THE BEMUS BALL CONTACT TIMER



STOPS THAT SKIP. By reason of the method of mounting—on the time shaft—the main cause of skipping is eliminated. You will be surprised at the improvement here.

SMOOTHES OUT THE RUNNING to a degree which you would have believed impossible.

GIVES THE MOTOR MORE POWER, MORE SNAP, STEADIER PULLING, AND DOES AWAY WITH THAT JERKY RUNNING ON LOW THROTTLE.

PRICE $2.25

Reinforcement of advance arm by moulded-in steel bushing is a late feature.

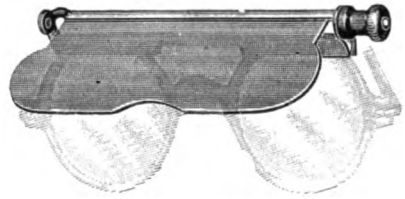
Patented { Mar. 24, 1913 / Dec. 15, 1914

WHEEL PULLERS

(Loose Plunger Type)

For Ford, Overland, Buick, Maxwell and Chevrolet Cars

Every practical man knows that the only way to start a wheel which is stuck or "frozen" to the axle is to drive back the axle while pulling the wheel. Two men are required by the old method—the ordinary wheel-puller will never take off a stuck wheel—one man can do it easily with the MOSCO puller. They have loose plungers extending through the screws—and bearing on the end of the axle. A blow with a hammer on the plunger, a turn of the screw, another drive with the hammer, and the wheel is off—no matter how long it has been on, nor how fast it is stuck. Information and prices on request.



MOSCO Valve Grinder

The working principle of this tool is entirely different from that of any other grinder, having an automatic reversing motion that eliminates all danger of rotating the valve too far in one direction. It is twice as quick as any other tool, and insures safety of valves even when grinding is done by inexperienced persons. The superior finish which is produced is a delight to every user. Now furnished with two forged tools—one for Ford valves and a standard universal tool for other engines. This is one of the best specialties we have ever made. Should be in every tool kit.

PRICE $1.50 EACH

MOSCO Adjustable Eye Shade

Fits All Goggles and Eye Glasses

Readily Applied by the User

LIGHT — COMFORTABLE — CONVENIENT — SAFE

The first and only real solution of sun glare and night driving problems.

This attachment provides a convenient and inexpensive means for protecting the eyes from any blinding glare from any source, especially from automobile headlights by night and from sun rays by day. It is in the nature of a visor, but is adjustable to any angle to meet rays of varying heights. The shield is made of transparent material which subdues blinding lights without obstructing the view.

Price (in paper carton), 50c. each
Price (in leatherette case), 75c. each

Look Well Into Burd Rings

SPEED 102.25 MILES PER HOUR

"The Surprise of the Day," said the reporters when the Packard Twin Six, equipped with 36 Burd High Compression Piston Rings, circled the Sheepshead Bay track at the rate of 102.25 miles per hour.

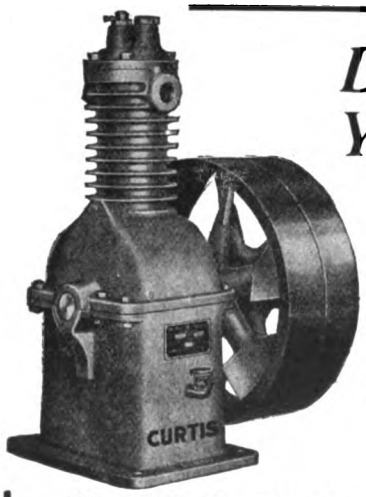
No stock car driven by a non-professional had ever traveled that fast.

Surely such an achievement naturally would occasion surprise.

Yet when you stop to consider the construction of the Burd Ring, and come to realize how it conserves every atom of power generated by the motor, you may well appreciate why the engineering department of the Packard Motor Car Company adopted Burd Rings as standard equipment.

The Metallic Guard effectually closes the ring opening against escaping gas and maintains the maximum compression the designer intended the motor should have.

These two elements mean more power, and power is, of course, the first essential necessary to speed.



You will do well to look well into Burd Rings when overhauling your own or your customer's car.

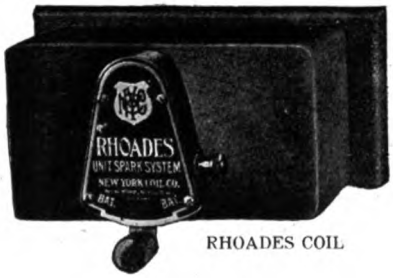
Our line of accessories for the Ford car comprises only articles that the owner really requires and which he can EASILY install

LONG specializing, extensive advertising, and the production of many patented devices for this particular car of which we are exclusive manufacturers has made our product a by-word in the home of every Ford-owner.



Live dealers everywhere are cataloging our goods—if *pou* fail to do so "we both lose money." We will be glad to furnish you electros, advertising copy, and jobbers' prices for your catalogue. May we do so?

The New York Automatic Head Light Controller for Ford Cars

PRICE $5.00 COMPLETE

This is positively the only device on the market that has solved the problem of operating electric lights satisfactorily from Ford flywheel magneto. It produces a light equal in power to the best storage battery-dynamo systems; as the value and necessity of this system is so great every Ford owner is a prospective customer. Furnished complete and strictly guaranteed.

RHOADES COIL

The New Rhoades Ignition System with Fittings for Ford Cars

PRICE $20.00

RHOADES UNIT SPARK SYSTEM

The Rhoades new battery ignition system increases the value and efficiency of the Ford car to an extent almost unbelievable. It dispenses entirely with the troublesome vibrating coils and supplies a magneto-type spark which insures a wonderful increase in power, a remarkable smoothness in flexibility and transforms the Ford into the class of the most expensive cars. It is operated entirely by six dry cells, which supply sufficient current for 2,000 to 4,000 miles running. Six years of hard service has proven it to be superior to the best high-tension magneto—or any existing ignition system. Price $20.00 *complete* with instructions enabling anyone to successfully install in one hour.

New York Model "TX" Master Vibrator

LIST PRICE $8.00

Our famous Model "T" Master Vibrator is recognized by all Ford owners as the most valuable accessory possible to procure. Its use eliminates hard starting and dispenses with all necessity of keeping vibrating coils in adjustment.

A hot powerful spark is delivered which both increases power and speed and relieves the owner of all ignition trouble and replacement of vibrators.

It has been recognized for years as the standard in its class.

BAILEY GEARLESS DIFFERENTIAL

Ford, Overland and Chevrolet. 490 Replacements Now Ready.

Laugh at Snowy, Slushy, Slippery Roads

That's what thousands of motorists will do this winter—what you can do as well if you equip your car with the Bailey Gearless Differential.

It will pull your car through bad spots where you'd be hopelessly stalled without it. For all the power is always delivered to the wheel having traction. The loose wheel doesn't spin around, "sand-papering" the tire.

It makes skidding, slipping and sidesway things of the past. Thousands are in use—every one sold on a 30-day money-back offer.

See your dealer, or write for circular.

Akron, Ohio—Branches and Dealers Everywhere

Every little item pays a big profit

That's why you, Mr. Dealer, should stock the "Chemically Correct" line.

First in the list is

SE-MENT-OL

The Original Self-Acting Radiator Cement

Absolutely scientific, yet is simple as A, B, C. "Finds the leak and fixes it in fifteen minutes." Dissolves in the water and congeals into a cement at the edge of the leak.

Retail price, 75c.

CARBONOX

The "Chemically Correct" carbon remover. Loosens the carbon and it is blown out thru the exhaust. Should be used regularly about twice a month to keep cylinders sweet and clean and engine running at its best. Far superior to the old way of allowing carbon to accumulate until drastic mechanical methods are necessary.

Retail price, 75c.

PIONEER Valve Grinding Compound

Made from the highest grade abrasive material, contains no ground glass or powdered emery. Coarse, fine and medium. Put up in a variety of containers, most popular of which is the double end box containing two ounces of coarse and two ounces of fine, **retailing for 25c.**

DU PONT FABRIKOID

How Many Cars Have Hides?

a sequel to

"How Many Hides Has a Cow?"

MORE cars are now upholstered in Du Pont Fabrikoid than in any other material.

The number of automobiles upholstered in hide leather counting all grades, *real grain leather* and *splits* or so-called "genuine leather" is steadily diminishing.

About 20% of the new pleasure cars sold in 1915 were upholstered in hides or hide splits. About 10% were upholstered in cloth. Of the remaining 70% upholstered in leather substitutes the majority were in Du Pont Fabrikoid, Motor quality.

Four years ago nearly all automobiles were upholstered in good leather, *but* 1915 production was just about twice that of 1912; in the meantime the hide supply has been steadily decreasing, and finally the war demand for shoe and harness leather has made prices soar.

The attempt to meet the famine in real grain leather, by splitting the hides and selling the coated and embossed splits as "genuine leather" has been a failure.

The public has learned by experience that there is a vast difference between real grain leather and so-called "genuine leather." Today automobile manufacturers face the choice of real grain leather or its nearest popular competitor, Du Pont Fabrikoid.

Real grain leather, because of its scarcity and high price is out of the question for popular priced models that are produced in any considerable quantity. Therefore, since coated splits, masquerading as "genuine leather," have proved impractical, the decision of the greatest makers of popular cars has been in favor of Du Pont Fabrikoid, Motor Quality, proved the most desirable after several years use on hundreds of thousands of automobiles.

Du Pont Fabrikoid is not leather, but a scientific substitute therefor, which has made good. It has the artistic appearance and luxury of real grain leather, and in addition is waterproof, washable and will outwear the grade of "genuine leather" used on 90% of the cars that "have hides."

Fabrikoid Rayntite Tops are guaranteed one year against leaking. They do not get shabby, because they are washable and fadeless, and will not hold grease nor dust.

Booklet and small sample of Motor Quality sent free. A usable piece, 18x25 inches, sent postpaid for 50c.

PEERLESS
PISTON RINGS

IT'S ALL IN THE LOCK JOINT

Mud, Snow and Gravity Conquered

On the big hills, with rough going over mud and snow, sticky and heavy roads, everything contributing to hold the car back. That's when the car needs every ounce of energy the motor can develop. It is precisely under such conditions that Peerless Piston Rings prove their value most conclusively. The car will make good if the engine is given a fair chance. Peerless Piston Rings give every cylinder a square deal, keeping compression where it is wanted and making combustion clean and effective.

A motor can develop its rated horsepower only as long as its piston rings remain tight. When compression leaks power efficiency goes down. Nevertheless, it costs just as much as if the full power were delivered—costs more in fact, for leaky piston rings result in steady deterioration and ultimate repair bills. That's why it's cheaper to use the best—

PEERLESS

PISTON RINGS

MADE IN CHICAGO

They conserve efficiency by keeping the motor *permanently* compression tight and carbon proof. This is accomplished by means of superior construction. It is one piece and still flexible—a result attained by the exclusive patented *Lock Joint*. The ring exerts an even pressure all around. Not a particle of compression can escape.

Peerless Piston Rings are an investment that pays interest on every mile of rough going. They put new life into old motors, making them as good as the day they were built. Years of compression practice has proven to engine builders that an eccentric piston ring with the original foundry scale of the metal left on the inner surface is the only type that is mechanically correct. It has but one defect—*it leaks*—this defect is obviated by the Patent Lock Joint in this ring.

Dealers: Our money back proposition clinches sales. We make good—so do the rings—That's why they don't come back. Liberal terms—fast sales—will you have details?

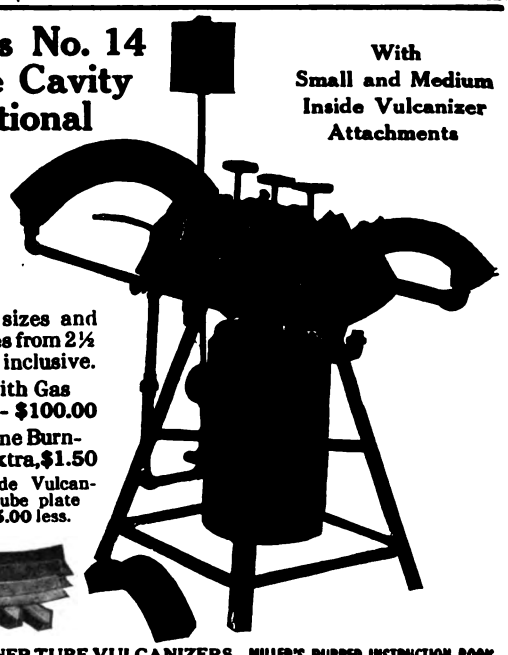
Pure Fine Para Gum for making acid Cure or Cold Patching Cement, washed and dried....Net,	1.10
*Miller's Three in One Repair Stock	.80

*This stock repairs casings and tubes and makes Cement, and eliminates the necessity of carrying a large variety of repair material.



The above prices subject to 5 per cent. discount for cash with order, or in 50 lb. lots or over, 10 and 5 per cent. On 100 pound orders, Freight Paid.

Miller's No. 14 Three Cavity Sectional

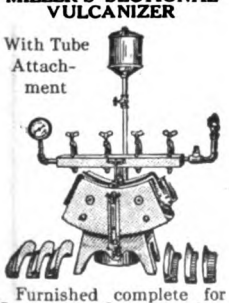
One of the 53 Styles We Make

Patented July 21, 1908

With Small and Medium Inside Vulcanizer Attachments

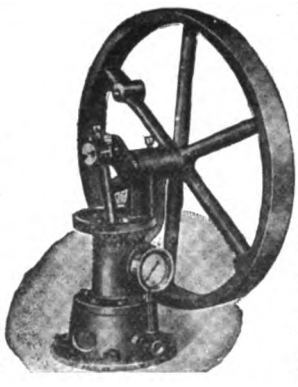
Repairs all sizes and styles of tires from 2½ to 5 inches inclusive.

Complete with Gas Burner - - $100.00



With Gasoline Burner Outfit, extra, $1.50

Without Inside Vulcanizers and tube plate instead, $5.00 less.



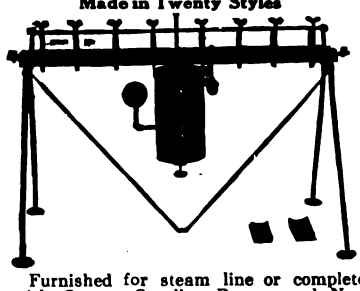
MILLER'S SECTIONAL VULCANIZER

With Tube Attachment

Furnished complete for Steam Line, Gas or Gasoline Burner. Complete with High Stand and Gasoline Outfit - - $36.50

MILLER'S HIGH PRESSURE AIR PUMP

is Oil Cooled with our Fountain Oiling system. The Bearings and Valves are extra large. The Bore of the cylinder is 3¼ inches in diameter and the Stroke is 5 inches. Diameter of Fly Wheel is 30 inches with 3 inch Face. Approximate Weight 200 lbs. This pump will easily compress air to 300 lbs. pressure.



Write for details.

Junior, Single, $25.00

Pump Only, Price, Single, $35.00

MILLER'S INNER TUBE VULCANIZERS

Made in Twenty Styles

Furnished for steam line or complete with Gas or Gasoline Burner, and New Improved Boiler. This Boiler generates an abundance of steam.

PRICES FROM $5.00 to $30.00

MILLER'S RUBBER INSTRUCTION BOOK

Price Prepaid, $1.00, Net

Free Instructions with each outfit.

FREE—*Write for our 1916 catalog which lists Vulcanizers of* All Sizes *and* Styles, *and Equipment for Tire Shops. Write for prices on* Miller's Heavy Wrapped and "Cog" Tread Tires *and* Heavy Red Tubes.

Try this Repair Outfit

At Our Expense. Every GARAGE, PUBLIC or PRIVATE, needs this BIG, STRONG, COMBINATION OF TOOLS called the

STEWART HANDY WORKER

Weighs Boxed 90 Pounds

Price Complete Only $12.50

If you bought all the tools you get with it, of the same high quality, strength and durability, and the equipment to operate them, they would cost you at least $25 at wholesale price.

A complete, compact workshop that you can attach to a table or bench anywhere about the garage and make it pay you big profits.

NOTE WHAT IT INCLUDES

A strong, practical anvil; powerful vise, up to 4½ inches, width of jaw 4 inches; a sure-grip steel pipe vise, takes up to 1½ inch pipe; a Corundum grinding wheel, 5 inches x 1 inch; a two speed drill press with 2 drills; a metal cutting wedge and driving mechanism of three speeds—direct, 4 to 1 and 16 to 1—easily regulated by changing the handle grip. It operates grinding wheel, buffing wheel and many other similar tools. With the Stewart "Handy Worker" you can do much of your own car repairing, etc., blacksmith work, home repairing, make plumbing repairs, keep knives and other cutting tools sharp and in good working trim.

READ OUR SPECIAL OFFER

Send for one of these great combined outfits today with the understanding that if you don't like it in every way you can ship it back and we will return every cent you paid out. Of all the thousands shipped, not one customer has made a single complaint. It pleases every customer, but our standing offer to return every cent paid out holds good to each purchaser.

SEND ONLY $2.00 WITH YOUR ORDER and pay the balance when it arrives. ORDER TODAY OR WRITE FOR BOOKLET.

Cold Weather Starting Made Easy

Fig. 3—No. 51-D Straight Dash Type.

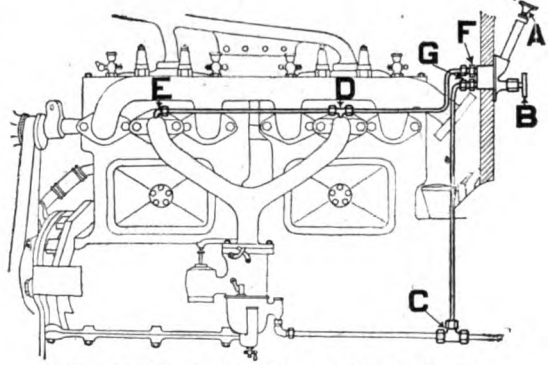
Here is a simple, easily installed device that throws a rich mixture into the Manifolds and enables you to start your engine on the first turn over in **cold weather.** On cars equipped with Self-Starters, the

IMPERIAL "PRIME-UR"

(It gives you the spray—you start right away)

prevents exhaustion of storage batteries, eliminates bother and loss of time in priming, while its advantages are instantly apparent to anyone who has cranked a stiff engine by hand in cold weather.

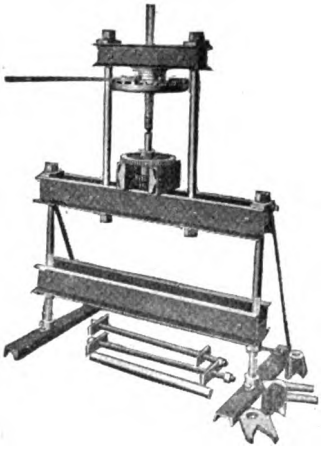
Furnished complete with tubing and connections, ready to install—no soldering, flaring or threading necessary.



It is endorsed by thousands of satisfied users.

Live dealers everywhere are selling the Imperial "Prime-ur"—Write today for liberal dealers' proposition.

We also Manufacture Imperial Welding, Cutting and Decarbonizing Outfits.



Imperial Brass Mfg. Co.,

520 So. Racine Ave., Chicago.

Showing No. 51-D Installed on Straight Dash.

TOOLS NECESSARY IN YOUR GARAGE

THE UNIVERSAL AUTO PRESS

Capacity 20 Tons. The Screw does not revolve. It is 2 inches in diameter, 4 pitch thread, highest grade of steel. The most practical Garage Press ever brought out, with its capacity of 42 inches for the largest truck wheels. It will handle all your work, big and little, quicker and better than any press at any price.

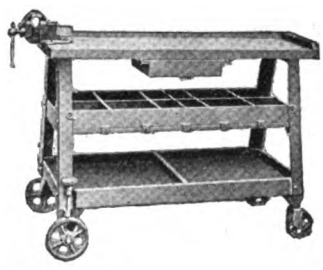
Complete equipment furnished as shown in cut.

LIST PRICE, $55.00

THE EVERY WAY ENGINE STAND

A most practical support for engines in overhauling, etc. Can be revolved to any position, 100 if desired. Rigidly locked instantly in each position. You can get at every part of the engine with the greatest ease and the least obstruction. Cross bars included in the price for three point suspension motors which are universal in all adjustments.

Any kind of motor can be mounted from the smallest to the largest.



List Price $32.00

THE HILITE PORTABLE CRANE

It is not top heavy. A necessity in every Garage, it will handle the work such as no other method can, quicker, better and without danger. One man is all you need with this Crane for any job. The Hilite Crane is built with a cast iron base and light steel superstructure and has the lift and overhang that is necessary for Garage Work. It therefore has less weight, less bulk and is stronger than other cranes. Built in one and two ton capacities with four lifts from 6' 6" to 8' 0".

LIST PRICES:
From $64.00 to $82.50

QUICK ACTION PORTABLE BENCH

Push it easily and quickly to any car in any part of the garage for small repairs. All the tools and supplies at your finger tips. Just right in size for practical work. After once in use you will find this bench the handiest thing in your garage. Invaluable for tearing down a car, keeping all the parts together.

LIST PRICE $27.50

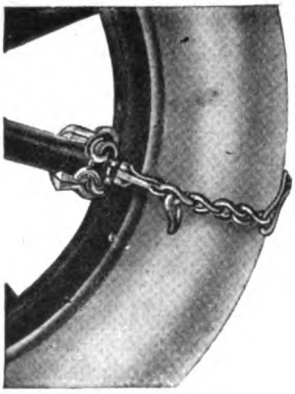
Automobile Accessories Worth Knowing About

TROUBLE-PROOF TIRES



The Woodworth Trouble-Proof tires have a leather strip in them which makes them puncture-proof without making them at all stiff or hard riding. They are guaranteed against punctures or blow-outs for 5,000 miles, and on light machines they generally last 10,000 to 15,000 miles. Woodworth Trouble-Proof Tires are carefully hand made from the very best materials obtainable and will not only give trouble-proof service but will last so much longer that they are much cheaper to use than ordinary tires.

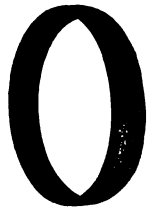
Send for our new Booklet entitled "*Trouble Savers for Tire Users.*"

WOODWORTH TIRE OVERSHOES

A light weight tire covering completely enclosing the tire, fastened to the rim. Made of leather that is absolutely water-proof and guaranteed not to stretch when wet. The Overshoes are finished on the inside with a special finish which makes them adhere to the tire, preventing friction and wear on the rubber. They are puncture-proof, protect the tires from all outside injury and road wear and do away with the bother of chains for wet and muddy roads. They are very low in price and will save much more than their cost besides doing away with punctures and skidding.

EASYON CHAINS

are individual chains fastened to the spokes with leather covered fasteners that do not injure the paint. The cross chains are of special design that do not cut or wear the rubber. If you carry **EASYON CHAINS** you can be sure you will not get stuck in any place where the car has power enough to drive it. Instead of wearing out your tires and chains continuously in wet weather, you can run with bare tires and put the chains on after you find they are needed, thus saving a great deal of wear on the tires and chains.



EASYON CHAINS are packed with a set of 8 in a bag, 4 for each rear wheel, enough to give traction on any roads.

Made in three sizes:

Size 3½ fits 3 in. or 3½ in. tires, $2.60 per set.
Size 4½ fits 4 in. or 4½ in. tires, $3.50 per set.
Size 5½ fits 5 in. or 5½ in. tires, $4.50 per set.

Sent express prepaid on receipt of price to any part of the U. S. or Canada with the understanding that if they are not satisfactory, you may return them at our expense and we will refund the full amount paid.

NO-SLIP, NO-STRETCH FORD FAN BELT

A belt made of very strong non-stretching fabric, faced on the inside with specially prepared leather which takes an excellent hold on the pulleys. Most satisfactory and durable Fan Belt on the Market.

SPRING OILER STRAPS

SPRING OILER STRAPS are leather straps with a lining of heavy wicking. There is a hole in the top through which to squirt the oil on the wicking. The wicking carries the oil to the sides of the springs where it works between the leaves when they are in motion as one runs over the road. They fit all makes of springs: very easy to attach.

Woodworth Overshoes, Easyon Chains, No-Stretch, No-Slip Fan Belts and Spring Oilers will be sold by all the first-class dealers in automobile supplies for 1916.

Send for 1916 Catalog telling about these and other goods that you will be glad to know about.

A JOURNAL OF PRACTICAL MOTORING

Registered in the U. S. Patent Office

VOL. XX, No. 5. NEW YORK, JANUARY, 1916. PRICE { 10c PER COPY / $1.00 PER YEAR

TIMING THE VALVES.

Highly Important That It Should Be Correct to Secure Good Results.

BY C. P. SHATTUCK, M. E.

The price of gasoline has nearly doubled since June and predictions are made that a gallon of motor fuel will cost 35 or 40 cents by next spring. Various reasons are advanced for the increased cost, but unfortunately the motorist is confronted by a fact not a theory, and the fact is that the fuel bills will have increased over 200 per cent. by the time warm weather arrives.

The average motorist believes that if nothing can be done to lower the price of gasoline its high cost necessarily involves economy of operation. There is, however, a remedy. It is not applicable to the brand new car but it can be successfully applied to a machine that has seen considerable service. The remedy is to thoroughly overhaul the valve mechanism of your motor and time it accurately.

The writer holds that the majority of motors that have been in operation for several thousand miles without attention are running out of time. This is meant to apply particularly to four and six-cylinder motors. Accurate timing of an internal combustion engine is highly important if maximum efficiency is

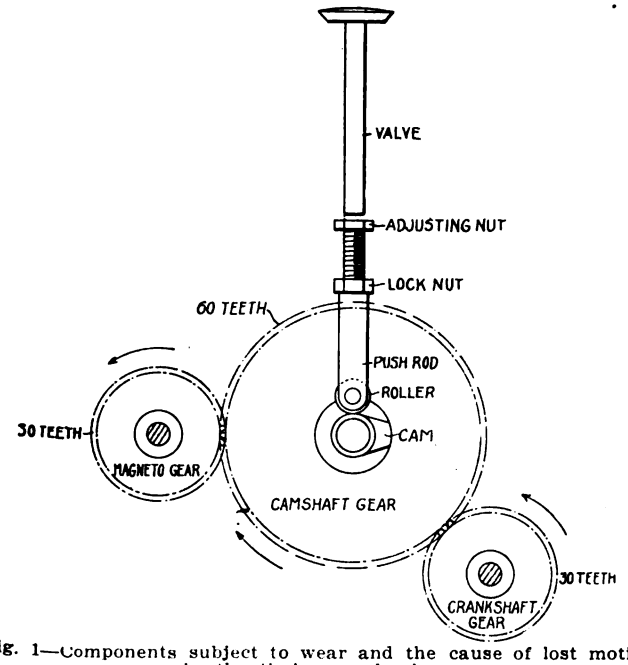

Fig. 1—Components subject to wear and the cause of lost motion in the timing mechanism.

to be obtained from the fuel. The falling off in power and decreases in mileage a gallon of fuel is generally so gradual that the average owner does not notice it. When it is discovered that the mileage is below that formerly obtained many owners blame the carburetor or ignition, and while they may be factors they are negligible when compared to faulty valve action and timing.

The reason why it is important that the motor be timed accurately is based upon the necessity of igniting the mixture between the interval of inspiration and that represented by the power stroke. The best results are not to be obtained if the mixture be allowed to burn during the power stroke which should be devoted entirely to the expansion of the gases. On the other hand the ignition should not

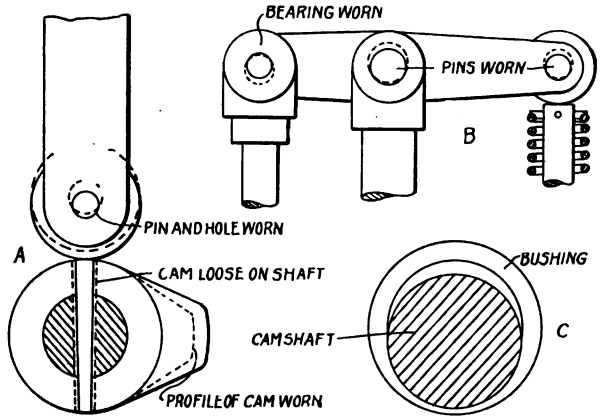

Fig. 2—Illustrating common causes of play in valve timing, the dotted lines indicating lost motion.

occur before the completion of the intake stroke. In poorly timed motors the gas being taken in is reduced below the best level and the work that the compressed mixture is capable of doing falls below par because the burning of the mixture is prolonged into the power stroke.

Incorrect timing is responsible for poor carburetion and induction due to the intake valve opening too early, allowing the exhaust gases to affect the mixture and to the exhaust gases not being completely expelled before the intake valve opens. A late opening of the exhaust valve or a too short a period will bring about the last named condition. These defects are more prevalent at high motor speeds and result in the cylinder not being filled with the mixture and are caused by too short an intake period or to a late opening or closing. When the opening is late counter currents are induced in the branches of the intake manifold caused by the piston that has completed the suction stroke and is compressing, forcing a part of the mixture back. When the exhaust period is too short or the valve is late in opening, some of the gases occupy space that should be given over to the incoming fresh mixture. The presence of burned gases not only impairs the burning of the charge, but they affect the output of the motor because of the presence of carbon dioxide in the exhaust.

The writer does not wish to convey the impression that the factory timing of the motor can be improved or altered and good results obtained. But the components responsible for faulty timing can be adjusted and if these be worn, restored to an efficient condition. The work will usually involve other than grinding in the valves and readjusting the valve

Digitized by Google

tappets to offset the space occasioned by natural wear of the valve mechanism. While such work will improve the operation of the motor in that the timing will be improved, there are several other factors that should not be overlooked, especially with an old motor. Good results can only be expected when the work includes a thorough overhaul of the valve mechanism, particularly the guides and valve stems. Worn guides are responsible for much needless

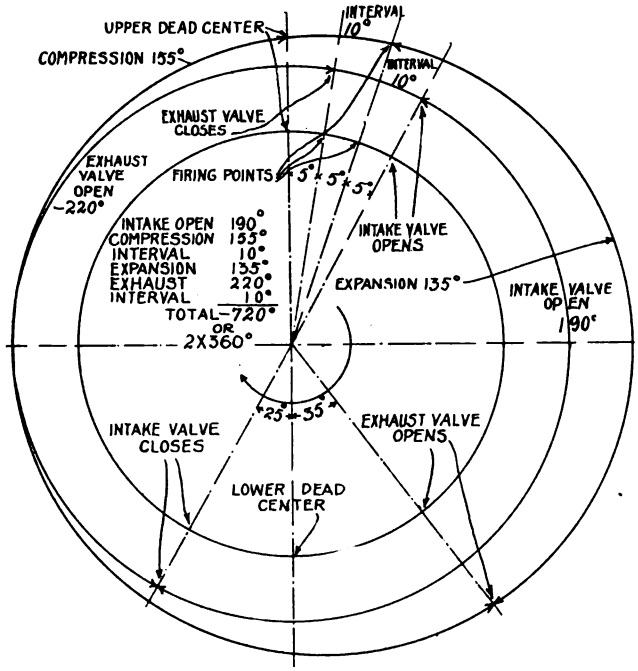

Fig. 3—Timing chart for two and four-cylinder motors with strokes laid off in degrees.

waste of fuel in that they admit extra air diluting the mixture and particularly at low speeds. To compensate for the extra air the fuel supply is increased, obtaining an excessively rich mixture at operating speeds.

The necessity of the valves seating properly is too well known for comment, but it is suggested that the springs be carefully examined, especially those having the same diameter throughout their length. These are not always square at their ends, and exerting an uneven pressure on the valve stem cause the valve to seat unevenly. This is not noticeable when grinding in the valve, and the seat may be perfect. Not only should the ends of the springs be square but the springs should be tested for strength and resiliency.

There are factors other than the spaces between the valve stems and the tappets that contribute to incorrect timing of a motor. Starting with the application of the energy of explosion to the crankshaft, thence through the crankshaft gear to the gear actuating the camshaft, it is possible that the teeth of these gears are worn, a condition resulting in lost motion. Play may exist in the camshaft bushing as indicated at Fig. 2 C, or the cam proper may be loose on the shaft as illustrated at A. A common cause of lost motion is indicated in the same sketch illustrating a conventional method of opening a valve. As a rule the roller does not wear but the pin retaining it in the plunger not only decreases in size but it increases the opening in the roller. The dotted lines emphasize the lost motion as do those showing how it is possible for a cam to wear. Motors with the overhead type of valve operating on the principle shown at B develop lost motion in the valve mechanism at the points indicated by the dotted lines in the drawing.

It is essential that any existing faults be corrected before attempting to retime the motor. While it may appear that these faults be minor individually, yet in the aggregate they mean considerable lost motion. For example: Assuming that there be ten places having lost motion and that each is a 25-1000 of an inch. The aggregate wear will be 250-1000 or one-quarter of an inch.

The work of retiming the motor is not difficult when the flywheel is marked. As a rule the opening and closing point of each valve, exhaust and intake, as well as the upper and lower dead centers, are marked at the factory. If the flywheel is not marked a timing diagram will be necessary and it can generally be obtained from the factory. If the timing cannot be secured, the motor will have to be timed in a general manner and changes made until the desired results are obtained. Methods for timing unmarked motors as well as how camshafts may be reset to overcome certain troubles due to incorrect timing and wear, will be discussed in logical sequence.

Different marks are utilized on flywheels. The centers may be indicated by the litters U D C and L D C, meaning upper and lower dead center, or may be denoted by C, both upper and lower, or a line scribed on the periphery of the flywheel. The opening and closing points of the valves are also marked on the flywheel and these are indicated by letters,

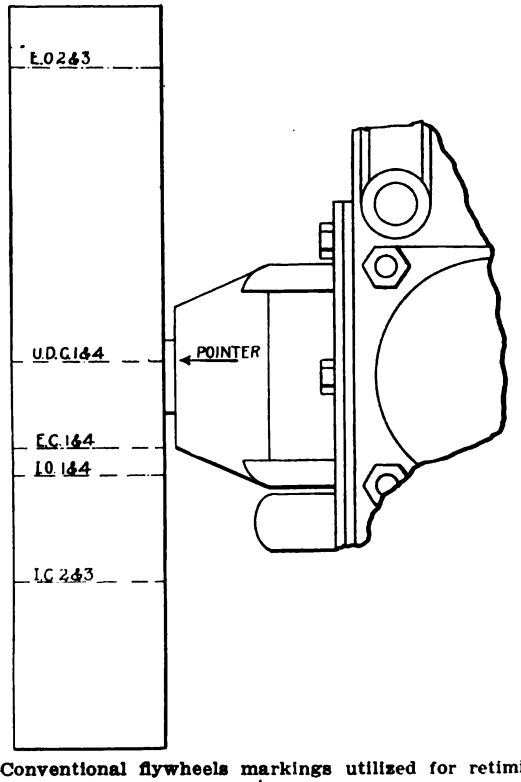

Fig. 4—Conventional flywheels markings utilized for retiming the motor.

generally as follows: I O, I C, meaning the opening and closing point of the intake valve, and E O and E C, the opening and closing of the exhaust valves. The letters are usually followed by numerals indicating the cylinders. This is illustrated at Fig. 4 which shows the markings of a flywheel of a four-cylinder motor.

The utilization of two figures such as E C1 and 4

Digitized by Google

is puzzling to the motorist not familiar with the work of checking the timing of a multi-cylinder motor, but it is very simple when one takes into consideration the cycle of the motor. The reading of a timing diagram is not difficult if one will apply the cycle of the motor and take into consideration the fact that 360 degrees represent a circle and that two complete revolutions or 720 degrees represent the cycle of the engine. This is shown at Fig. 3 which illustrates a timing chart for two and four-cylinder engines.

Upper and lower dead centers divide the circle into 180 degrees. As may be noted, the intake valve opens 15 degrees after the upper dead center line has passed an imaginary mark or pointer denoting the dead center. The valve remains open until 25 degrees after lower dead center when it closes, consequently the period of opening is 190 degrees. The exhaust valve opens 35 degrees before lower dead center and closes 10 degrees after upper dead center, it having a period of 220 degrees.

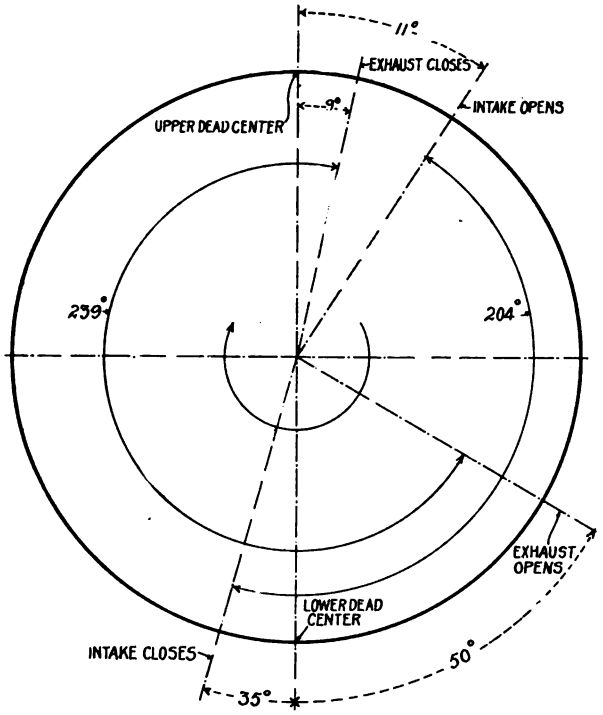

Fig. 5—Timing diagram showing the average timing of the intake and exhaust valves.

The periods of compression and expansion are also given. That for compression is 155 degrees and is easily figured as follows: The intake closes 25 degrees after lower dead center and as the piston attains its top dead center position after 180 degrees or half a circle travel, we deduct 25 from 180 which gives 155. The expansion period is 135 degrees as we deduct 10 degrees, the point the exhaust valve closes and 35 degrees, the point it opens, from 180 degrees. Intervals of 10 degrees are allowed in this diagram. The markings of 5 degrees are made to utilize the chart for timing low and high speed motors. As may be noted the periods of intake, compression, expansion, exhaust and intervals equal a total of 720 degrees or 2x360 degrees, the cycle or two complete revolutions of the flywheel. These points are explained at length to enable the motorist to time two valves at the same time; that is, to check up the timing of the valve that follows the No. 1 without rotating the flywheel until the No. 2 valve starts to lift, etc. This will save time as well as labor.

Before beginning the work of checking the timing, remove the spark plugs to relieve the compression and to make easy the work of rotating the flywheel by hand. The first step is to locate the dead centers. Rotate the flywheel until the piston is at the top of its stroke and the crankthrows of the shaft exactly vertical. When in this position the line marked U D C should coincide with a pointer similar to that shown at Fig. 4. If a pointer is not provided, prick punch the cylinder directly opposite the line indicating center on the periphery of the flywheel. Knowing the firing order of the motor is of assistance in the work.

(To be continued.)

THE GASOLINE PROBLEM.

Looking Vainly for a New Fuel as Price Continues to Soar.

From Alfred Reeves, Automobile Chamber of Commerce.—Of all the problems that we find nothing is of greater importance than the question of a fuel supply at a moderate price. There has been ample fuel for our needs up to this time, with a wonderful distribution so it is obtainable almost anywhere, yet of late the price has been increasing at a rate which is a menace to the growing use of motor cars and of internal combustion engines generally, such as those used on farms and in boats.

Our engineers have worked, and are working, with the result that we have the efficient cars of to-day supplying almost double the mileage on a gallon of gasoline of the cars of six or eight years ago, yet this greater efficiency in mileage per gallon is offset by the greater uses we have for motor cars and the increased cost of the fuel itself.

One reason after another has been offered for this advance in price, the oil companies finally getting down to the statement that it is now a matter of supplying the demand and pointing to the fact that five years ago we used approximately 2,500,000 gallons of gasoline per year in motor cars, while during the past year the consumption was not far short of 1,000,000,000 gallons.

If there continues to be a shortage in gasoline and the price increases, we must look for some new fuel. Its arrival is certain, because there never has been a crying demand for anything without an answer from engineers and inventors. Such new fuel may come from crude oil, but more than likely it will be a chemical. Hail to the man who will deliver us from the need of gasoline in motor cars! Just think of the time when chemists will furnish us with tablets one of which in a gallon of water will provide fuel for your motor! Notwithstanding the increased quantity of gasoline we have had from the same quantity of crude oil, the price continues to advance. In the early days, with inefficient carburetors and heavy cars, six miles to a gallon was considered excellent.

One of the manufacturers' committees, on which I had the pleasure of serving, interviewed the Standard Oil officials a few years ago, who informed us that if we could use lower grades of gasoline they would be able to furnish ample for our needs. In other words, as they expressed it, more gasoline could be obtained if they could cut deeper into the crude and get an increased amount of gasoline from

Digitized by Google

each gallon of crude oil. At first cars would only run with gasoline of 72 degrees; then we got down to 68 degrees; then to 64 degrees, and now a large part of it is 58 to 60 degrees. Kerosene is about 45 degrees.

While kerosene could be used and would be cheap, it has up to this time exhibited a tendency to give off an odor when burned and also leaves an excess of carbon in the cylinders. The low grade of gasoline is a little more difficult to start on, but supplies more heat and is a better fuel for general work after the motor is under way.

The average car now will give fourteen to eighteen miles on a gallon, with some running as high as thirty-five miles, offering transportation at a pretty low cost. The new pumping systems of oiling enables cars to travel 500 to 800 miles on a gallon of oil.

It is certain that 1,000,000 and possibly 1,200,000 cars will be made during 1916, so that at least 3,000,000 automobiles will be running in this country at the end of this year. These cars will average 400 gallons of gasoline annually, a total of 1,200,000,000 gallons, while the oil consumption will be not far from 35,000,000 gallons of lubricating oil. You can see, therefore, the great problem that confronts the industry and the great opportunity offered for our great chemists to supply some form of new fuel.

MAGNETO OR BATTERY.

Comparison of the Two Systems by an Electrical Engineer.

Francis R. Hoyt, Simms Magneto Co., before the New York S. A. E.—In discussing the subject of ignition, where a comparison between systems becomes the objective, it is first necessary to divide these various systems into groups or classes, handling those in separate groups individually. For our analysis of battery systems, we will consider them in two divisions.

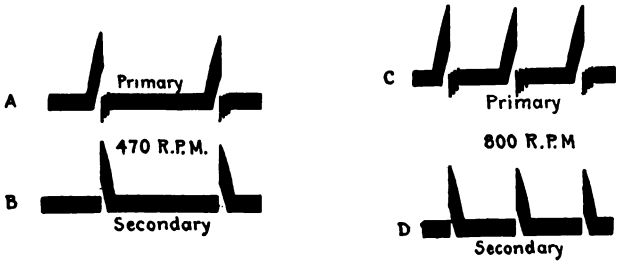

Fig. 1.—Current Waves of Open-Circuit Battery System.

In one division the contact-breaker is normally open and the necessary periodic closing is accomplished by some mechanical device for a definite interval of time regardless of the speed of rotation. This will be called the open-circuit battery system. In the majority of such systems the make-and-break is accomplished by a spring-controlled lever tripped or set in motion by a revolving cam. This action brings the interrupter points together for a very brief contact. Because of the comparatively short length of this time interval, the current in the primary winding of the induction coil can only grow to a very small part of its full ohm's law value.

The other division consists of those battery systems in which a normally closed contact-breaker is opened periodically by a revolving cam or its equivalent. In this type the current growth in the primary is in proportion to the speed of the ignition device, each increase in speed consequently being accompanied by a decrease in core saturation. These will be referred to as closed-circuit battery systems.

For our classification of magnetos we need consider only the high-tension type. This review treats of all high-tension magnetos whether the armature actually carries the inductive windings and rotates within the pole-pieces or the rotating member simply causes a periodic change of flux in the stationary induction coil.

Open-Circuit Battery Systems.

In the open-circuit battery system the current in the primary only rises to a small fractional part of its total value. The current waves that accompany the making and breaking of the circuit are shown in Fig. 1. Waves A and C show the growth of current in the primary winding at 470 and 800 r.p.m., respectively. The two current values are practically the same. The total current consumption from the battery, of course, increases with the speed, because of the greater number of interruptions per given interval of time. The secondary spark is of comparatively high voltage, and has practically negligible heat value and duration. The secondary waves B and D, corresponding to each speed, are shown below in their proper relation to the primary currents. These values remain practically constant regardless of speed. The inability to secure core saturation, and consequently heat value in the secondary spark, must be compensated for, and so the initial voltage is made great enough to produce a longer spark than other systems require. The higher voltage is secured by a big ratio of turns between the primary and secondary windings, and the thin spark thus obtained is relied on both for breaking down the resistance of the spark-plug gap and for ignition. As will be seen by the primary oscillograms, the current at the time of break is still increasing rapidly. The current value at the peak of the wave is 1.5 amperes, whereas if this current were allowed to attain its maximum, the full Ohm's law value would be 23.8 amperes. The time of contact is so short that the coil as operated is only 6 per cent. efficient, not considering electrical losses.

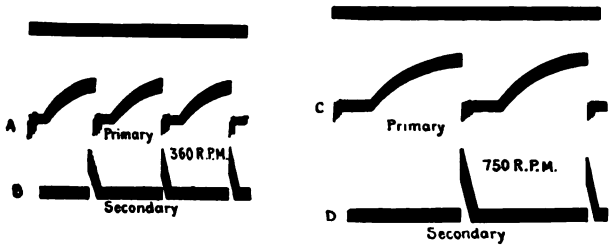

Fig. 2.—Current Waves of Closed-Circuit Battery System.

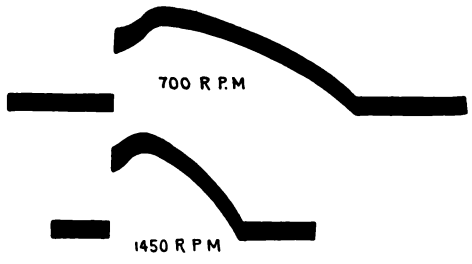

Fig. 3.—Secondary Current Waves of High-Tension Magneto.

In the normal closed-circuit battery systems, Fig. 2, the primary current growth, A and C, is regulated by the speed of the device and is the greatest at the lowest speeds, falling off rapidly as the speed in-

Digitized by Google

creases. The straight line above each of these waves represents the maximum current that would flow if the contact points remained closed long enough. The speed of the upper wave was taken at 360 and that of the lower at 750 r.p.m. These correspond to engine speeds of 740 and 1500 r.p.m. In these systems the heat of the secondary spark is proportional to the speed of the engine; the greatest spark

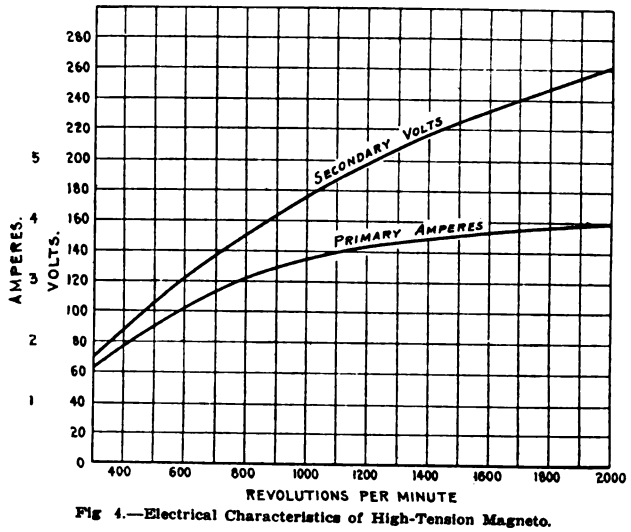

Fig 4.—Electrical Characteristics of High-Tension Magneto.

heat at the lowest engine speeds and vice versa. The secondary waves are shown at B and D in their proper relation to the primary.

The condenser proportions present some difficulties, as when the core saturation, to secure a higher secondary current and consequently a greater spark heat. The secondary spark is of short duration, being only slightly longer proportionally than that of the open-circuit group. The closed-circuit battery system having greater heat value, works with a shorter spark plug gap.

High-Tension Magneto Systems.

Fig. 3 shows oscillograms of the secondary current from a high-tension magneto, the upper at 700 and the lower at 1450 r.p.m. These are about the

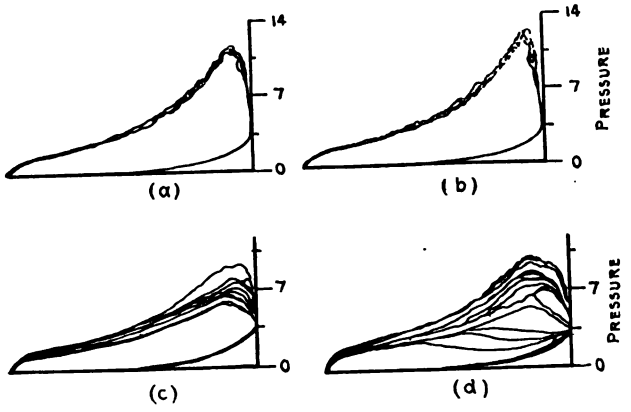

Fig. 5.—Indicator Diagrams Taken with Battery and Magneto Ignition.

same engine speeds as were used in making the battery oscillograms, and show clearly how the spark heat increases with the speed. The current waves of all three secondary circuits were made with the same damping and oscillograph connections so that the values are comparable. The shape of the magneto current-wave, Fig. 3, shows the well-known "follow-up" current, which is not shown in either of the battery-system waves. The secondary waves shown were taken from the type of machine in which the heat varies at different positions of the timing-lever, and are the waves of lowest order.

Ignition Requirements.

No matter what theory may be held as to the molecular structures of the gas particles in the combustion chamber, all will agree that flame propagation is not instantaneous, and that the rate of propagation, so far as the ignition spark is concerned, is influenced by the heat of the spark or flame area introduced into the cylinder. The greater this heat and the larger the volume of flame, the more quickly the compressed charge will burn. If the flame spreads more rapidly, the combustion will necessarily be better and the engine efficiency and performance increased.

This suggests a comparison between spark heat and spark advance. Take for illustration an engine in which we can switch suddenly from a spark of great to one of low intensity. It would then be necessary in order to have the piston begin its outstroke at the point of maximum pressure to give a greater angle of advance to the spark of lower heat value. It is only by this method that many ignition systems are operative to any degree of satisfaction.

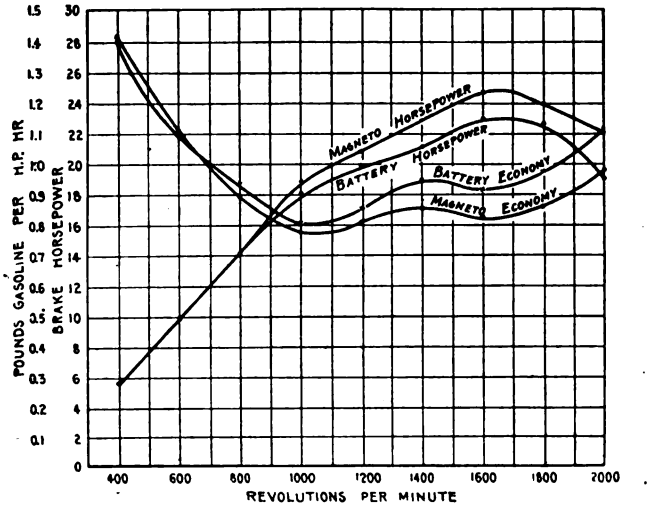

Fig. 6.—Economy and Horsepower of Magneto and Battery Systems.

This seeming method of substitution has, however, serious drawbacks, for the expansion pressure exerted before the piston has reached top-center tends to impede its upward progress, and the mixture is being ignited before becoming thoroughly homogeneous. Other losses also can be traced directly to the same cause.

Open-Circuit Battery System.

The secondary or ignition spark from an open-circuit battery ignition system is a spark of short duration, of practically no heat value and of constant intensity regardless of speed, depending for its flame area upon a slightly longer spark-plug gap. The igniting properties of a spark of this character will never be able "to lend a helping hand;" all speeds, all grades of mixture and all degrees of compression are treated alike. The same flame or spark will be introduced into the cylinder whether the engine is under high compression at low speed or low compression at high speed. In addition the spark must be timed accurately because it will not help compensate for any of its own irregularities, to say nothing of assisting the engine during varying internal conditions. In the type of interrupter me-

Digitized by Google

chanism used there is also a large mechanical lag, caused by the fact that the interrupter cam or its equivalent is rotating rapidly away from the lever that actuates the breaker mechanism, thus entailing time losses. This mechanical lag is proportional to the interrupter speed, but it must be compensated for by a further advance of the spark itself, thus introducing further complications.

This system has one structural advantage over the closed-circuit battery system, because the arcing

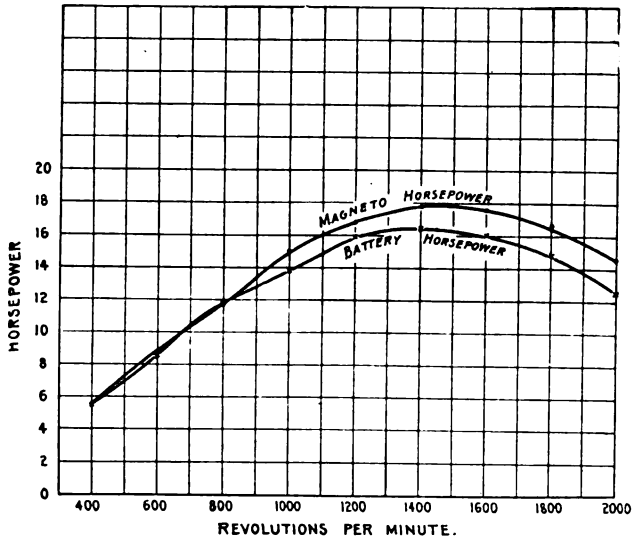

Fig. 7.—Power from Fixed-Spark Magneto and Variable-Spark Battery Systems.

at the contact points can be more nearly eliminated. The primary current growth is the same in all cases and the condenser that assists in eliminating the arcing can be graded properly.

Closed-Circuit Battery System.

In the closed-circuit battery system, the spark induced in the cylinder is more effective at low speeds without excessive spark lever manipulation. The current in this type however drops off very rapidly with increasing speeds. In battery systems in which the current draw on the primary is comparatively heavy (say three amperes or over) at starting speeds, there should be an extra source of battery supply; otherwise it will be found that the hot spark for winter starting is a myth. The drop in voltage across the terminals of the storage battery, due to starter load and an inefficient battery at winter temperatures, will prevent the primary of the coil from receiving the necessary current for good spark production. The secondary current wave is of about the same duration and of more heat value than those obtained in the open-circuit class, but as this heat falls off rapidly with an increase in speed, the question of spark advance is again involved. The flexibility, economy and power of the engine are under these conditions regulated solely by the skill of the driver. Every person who has ever driven a battery-equipped car must have realized the amount of practice and skill necessary to advance the spark with increasing engine speeds when under heavy load, without producing a spark knock. It may be well to add, however, that from a point of view of ignition results this construction is the preferred battery one, and comes much nearer meeting the demands of an engine. It is possible to produce a spark of greater heat value because of greater coil efficiency, than with the open-circuit type irrespective of whether the engine is at low or at high speed. The difficulty so often encountered, of draining the battery when the starting-switch is not thrown off has been the object of considerable engineering. Attempts to overcome this difficulty have been made, but where electrical means are used there is an inevitable loss by waste primary currents that must traverse the mechanism continually, and where mechanical means are employed, complications are introduced.

The inherent property of a high-tension magneto of delivering a spark of increasing intensity with each increase in speed is in direct response to the demands of an engine and to a large degree compensates entirely for spark advance. An excellent illustration of this is given in Figs. 6 and 7. Fig. 4 is a curve showing the actual primary current of a high-tension magneto and the generated and induced secondary voltages. These curves are plotted from readings taken with an alternating current voltmeter and ammeter. In obtaining the generated and induced secondary voltages the contact-breaker of the magneto was removed and the readings taken directly across the terminals, just as a voltage reading would be taken in the case of a low tension magneto. With any ignition device capable of increasing its spark heat with increasing speed, it will be found, particularly in the hands of the ordinary driver, that an engine is more flexible, that better combustion is secured, that slight carburetor errors are to a certain extent corrected, and that varying grades of gasoline, such as are now so common, will give good results without the annoyance of continual carburetor adjustment.

The magneto is the only type of ignition device that delivers a flow of current after the first or arc-

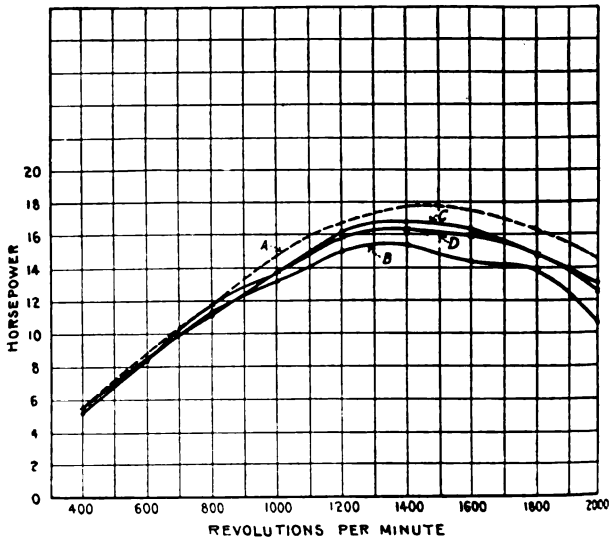

Fig 8.—Effect of Spark Variation on Battery System.

over voltage has passed. It has been said that the arc-flame or follow-up current of the magneto plays no part in ignition. This conclusion is based on the assumption that the gas in the combustion chamber immediately surrounding the plug is ignited by the first formation of the spark, and that consequently any additional flame at the spark plugs is of no value. It must be remembered that at the time of the occurrence of an advanced spark, the piston is traveling upward, and the mixture is being more and more compressed. Therefore the same par-

Digitized by Google

ticles of vapor are not being held in fixed relation (or "suspension") to the gap of the plug. A constant change is going on at the plug-gap, as well as at any given point in the cylinder, both in the formation of the molecule and in the position of the whole mass. Table I illustrates the position of the

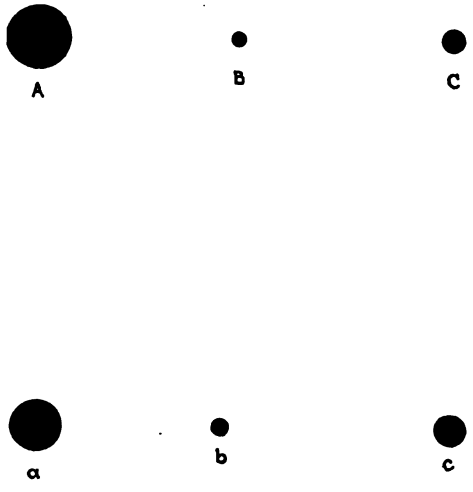

Fig. 9.—Spark Heat of Ignition Systems. Magneto, *A*, 1500 and *a*, 740 r.p.m.; Open-Circuit Battery, *B*, 750 and *b*, 370 r.p.m.; Closed-circuit Battery, *C*, 750 and *c*, 370 r.p.m.

piston in the cylinder with reference to different advanced spark occurrences.

Since the flame of the magneto follows the initial jump of the spark by a certain number of degrees (depending on the exact construction) its mission is one of extreme value, for in no other manner can the changing gas particles be placed in direct contact with the fundamental source of ignition. A substitute for this "follow-up" cannot be found in any other construction.

The ability of a magneto to produce sparks capable of igniting various mixtures is shown in the following: "If a car has both battery and magneto ignition, it is easy to compare the merits of the two methods by an indicator. Diagrams A and B (Fig. 5) taken by switching-in respectively the magneto and the coil, in both cases with a rich mixture, show no important differences in the results obtained from the two methods. But if a poor mixture is

used, both maximum and mean pressures during the working strokes are much more regular with magneto than with coil ignition, the diagrams C and D, Fig. 5, showing the difference. In some of the cycles the ignition from the coil progresses so slowly, as in diagram D, that the pressure does not reach its highest value until the end of the working stroke.

Fig. 6 and Table II gives some tangible evidence that the magneto increase of spark heat with speed is equivalent in large degrees to an actual spark advance. In this test a standard variable spark magneto was set permanently in the advanced position, and operated as a fixed spark machine. The battery ignition system was of the closed circuit type, and the spark was regulated manually. Even under these conditions the magneto developed greater horsepower with a lower consumption of gasoline per horsepower-hour. It will be seen from the power curve that the spark of the magneto was advanced a trifle too far for the best results at extremely low speeds under full load.

Fig. 7 shows another example of fixed spark magneto and variable spark battery ignition. In this case the battery system was of the open circuit type, and the spark was automatically advanced by the governing mechanism contained in the interrupter and distributer housing. The curves were plotted from the figures in Table III. These show a great loss of horsepower in the battery test, and a noticeable irregularity up to 1200 r.p.m. in the power curve, which probably was caused by the mixture taken in at these speeds not being suited for combustion by the thin spark of this system.

In both of the tests shown in Figs. 6 and 7, the spark plug gaps were set at the distance specified as correct by the different manufacturers. The carburetor adjustment was not touched in either case during the tests.

After the test described in Fig. 7 was made, the

*These two columns of figures show the time in seconds required to use 50 cu. cm. of gasoline.

automatic-advance mechanism of the battery system was prevented from operating and the spark controlled by hand. The spark was varied three degrees each way from the exact position taken by it at the various speeds when automatically controlled. This was done to determine what power variation, if any, was brought about by an early or late spark. The data secured from this test are given in Table IV and Fig. 8. The dotted line A in Fig. 8 is the magneto power curve from the preceding test.

No effort was made to determine the maximum power obtainable with a correct setting, but from the figures in Table III the power could not be exceeded to any great extent with this form of spark.

A direct comparison of the relative heat value of the different sparks is given in Fig. 9. This portion of a magnetograph chart represents the spark heat of a magneto (A-a), an open-circuit battery (B-b), and a closed-circuit battery system (C-c) at speeds corresponding to 740 and 1500 r.p.m. of the engine.

Fig. 9 leaves little further to be said regarding relative flame areas introduced into an engine cylin-

der by battery and magneto ignition devices. In this test the spark heat is recorded on a piece of blue paper chemically coated with a substance resembling white paraffin in appearance but with a lower melting point. The spark is caused to pass from a needle point through this chart to a grounded drum and in so doing melts away the white coating, leaving the blue paper exposed. The amount of

this coating melted away is in proportion to the heat of the spark, the value of which is represented by the blue area in view.

The electrical principle upon which an ignition device is constructed determines its possible performance.

The rate of flame propagation of a combustible mixture depends upon its quality, the compression and the speed of the engine.

For the best results the spark in an engine cylin-

der must occur at a time depending on the rate of flame propagation.

Spark advance while necessary is often (though inefficiently) used as a substitute for spark heat.

The unavoidable errors nearly always present in spark timing can be compensated for to a great extent by increasing the spark heat.

A spark of constant heat value and short duration (open-circuit battery system) must rely entirely on spark advance for meeting varying engine conditions.

A spark can occur too early even though from outward appearances the engine is operating correctly.

A spark that grows weaker (closed-circuit battery system) as the engine speed increases is wrong in theory and practice.

The larger the spark the faster the flame-spread and the greater the efficiency.

A prolonged or "follow-up" spark in any advanced position is necessary because of the constant change in the position of the gas vapor with respect to the spark-plug gap.

A spark that increases in intensity as the speed increases and burns in the form of an arc for a measurable period after its first passage (high-tension magneto) conforms directly to the requirements of an engine.

ALUMINUM ALLOY PISTONS.

Results of Experiments and How the Design Must Vary from the Iron Piston.

James E. DeAmond, before the Indiana Section of the S. A. E.—I will comment on some points of superiority of the aluminum alloy piston, although this will involve a repetition of statements more or less familiar, inasmuch as this type of piston has been the subject of much discussion in recent months. Certain phases of piston design also will be considered.

The weight of the aluminum alloy piston is, roughly speaking, one-third of that of an iron piston of the same design. It follows that the inertia forces due to the purely reciprocating mass, that is the piston itself, is reduced approximately 67 per cent. by use of the aluminum alloy piston. Moreover, the vibration-producing forces attributable to inertia conditions are decreased to the same extent, whether the vibratory force be due to lack of balance between opposed vertical forces present in vertical motors, or to unbalanced horizontal forces in V motors. Crosswise vibration is much more disagreeable than vertical, and the smaller the vibratory forces can be made, the more likely it is that the motor will absorb them within itself.

In reducing the inertia forces responsible for vibration, another desirable object is attained, the diminution of the bearing pressures engendered by these forces; this, of course, increases bearing life—a consideration of no mean importance. It is easy to underestimate the magnitude of these forces, but with the present tendency toward small-bore long-stroke high-speed motors, more attention must be given to this phase of motor design. It is quite safe to say that in some of the recent European racing products the inertia forces are of greater magnitude than the working forces in the motor.

The coefficient of friction of an aluminum alloy suitable for pistons is about 50 per cent. of that of cast iron. A slight gain in mechanical efficiency should result, and possibly the reduced friction explains a decided decrease in consumption of lubricating oil noted in cases in which iron pistons have been replaced by aluminum alloy pistons; doubtless the much greater heat conductivity of aluminum plays a part in this.

The greater heat conductivity of the aluminum

Digitized by Google

alloy piston explains why the carbon deposit on its head is less than on that of an iron piston; under favorable lubricating conditions very little if any carbon is deposited, and as a rule the little that collects is easily removable.

In case an aluminum piston seizes, it is damaged in rare cases only; and the cylinder is practically never injured. Seizure of an iron piston usually necessitates reboring and regrinding of the cylinder and frequently a new cylinder block.

Comparing the Cothias process and sand casting, I have found the permanent mold piston superior in every respect, most markedly and valuably in hardness; being 25 per cent. harder, its wear-resisting quality is proportionately greater. One of the troubles with aluminum pistons has been that they were too soft. They are now being made by the process mentioned of a hardness not much less than that of cast iron.

While the strength of the sand cast piston is sufficient usually, the increase of strength attainable by the process named should be welcome, the tensile strength ranging between 25,000 and 30,000 lb. per square inch, considerably higher than that of ordinary iron. In one case some sand cast pistons of scanty proportions failed in a few hours, and permanent mold pistons of the same design have run in service over 10,000 miles.

Permanent mold pistons can be produced more cheaply. They usually come from the molds with no more excess material than can be ground off in one operation. While some aluminum alloy pistons cannot be ground satisfactorily, the permanent mold pistons to which I am referring are being ground successfully in production. Kerosene is a suitable grinding medium. Turpentine also, I believe, will serve. The wrist-pin holes are cored and brought closely enough to size in some cases to require only a reaming operation.

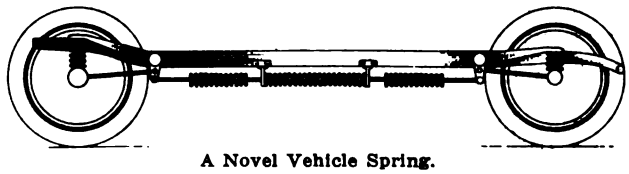
The percentage of defective pistons after machining operations is much less than in the case of sand cast pistons; in one instance in the proportion of one to ten.

It is doubtful whether sand casting foundry practice will ever be refined to a point where allowances for finish need not be as liberal as at present. The excess metal represents not only dead loss usually, but also additional expense in machining it off.

The design of aluminum alloy pistons can follow closely that for iron pistons. It is advisable, however, in my opinion, to rib the head to carry heat away from it better, eliminating the possibility of a gradual deterioration of the metal after being subjected to high temperature for a long time. Whether one rib or two be employed, if the rib in the plane of the bosses is dropped down to them, stiffness is had where required and the ring-carrying portion of the piston is bound more rigidly to the rest of the piston.

There are as many advocates of the practice of oscillating the pin in the piston as of locking the pin in the piston. Each construction has advantages, but it is clear that the former is cheaper and has given highly satisfactory results. In pistons of this type, which I have examined after many thousands of miles of service, the wear in the wrist-pin holes was not measurable.

Whenever possible, it is wise to increase the length of the piston, possibly as much as 25 per cent. This gives, of course, more bearing surface. It is also good practice to increase the width of the first land, as well as to fit the rings somewhat more tightly than customary in fitting rings in iron pistons.



No general rule can be laid down as to the clearances required, in view of the greater coefficient of expansion of aluminum. The proper clearances for each type of motor must be determined by experiment. In many cases if the piston barrel is tapered, it is possible to eliminate piston slap entirely, even when starting the motor cold.

The manufacture by the Cothias process of pistons with a so-called wiping ring at the bottom of the skirt is not commercial at present, if strict adherence to conventional design is insisted upon. As the process becomes adapted to the manufacture of pistons of the "hour-glass" type, however, the same end can be attained. Prejudice against this type of piston is very much less than it was. One of the large motor manufacturers is now using permanent mold pistons of the general "hour-glass" type. I am informed that the De Lage cars are equipped with this type of piston, and that it is standard with the Minerva, Clement and one or two others.

While developed for the iron instead of the aluminum piston the design in general works out well with the latter.

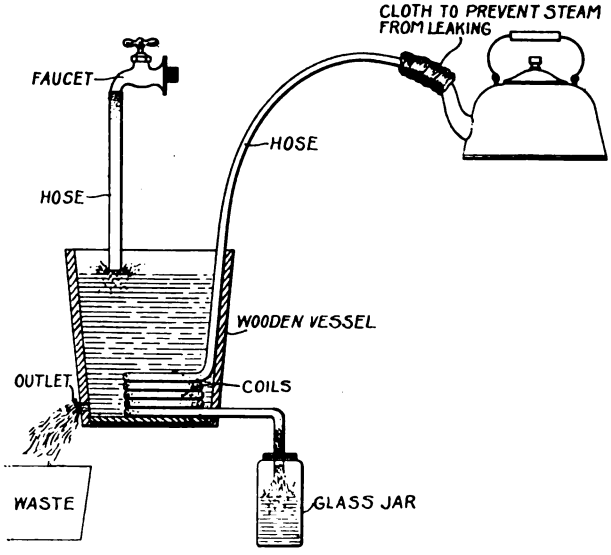
New Spring Principle.

A Melbourne, Australia, genius has invented a novel automobile spring suspension, which is illustrated herewith. Not only is the arrangement of springs and levers somewhat revolutionary, but the results of the tests made have been such as to call forth favorable comment from experts. As shown in the illustration there is an entire absence of leaf springs in the system, all the springs being of the spiral type and all working under compression. By virtue of the lever action, which for all its simple appearance is decidedly complex, the weight of the car is divided among the various springs. Not only is the downward tendency of the body, as when the car wheels drop into a hole, checked by the spring arrangement, but the rebound is caught, cushioned and absorbed. The system was recently tested out on a specially built car equipped with solid-rubber tires, and the value of the equipment demonstrated under unfavorable conditions.

A Novel Vehicle Spring.

For Distilling Water.

The instructions for caring for the storage battery are very specific and particular emphasis is made in the paragraph relating to the use of distilled water. Water drawn from the city supply through metal pipes and faucets or from wells or springs must not be used as it may contain salts or minerals. Distilled water must be kept in clean glass or earthen receptacles.



While it is a simple matter for the resident of the city to purchase distilled water, it is not so easy when one resides a considerable distance from the source of supply. For the benefit of those so located

Digitized by Google

the following suggestion for making a simple still will be of value.

The material required consists of a wooden vessel, suitable length of clean rubber hose and an ordinary tea kettle. The hose should be long enough to reach from the stove to the sink and large enough to fit inside or outside of the spout of the kettle. To obtain a steam proof fit, wrap the tube with cloth. Run the hose to the wooden vessel and make several coils in it. Bore a hole in the container at the side and near the bottom and run the free end of the tube through. As the tube is of rubber, a leak-proof opening can be made by drilling the hole slightly smaller than the diameter of the tube. Run another rubber tube from the water faucet to the vessel, also drill a small hole in the side of the tube near the bottom. Place an earthen or glass jar near the vessel and insert the free end of the coiled tube in it.

When the water boils in the tea kettle the steam

Home Made Still For Obtaining Distilled Water For Storage Batteries.

will pass through the tube to the coils, which being immersed in cold water, will condense the steam into water. The water will then flow into the glass jar. The flow of water from the faucet should be regulated so that the coils will be kept cold. A small plate gas stove or an oil stove may be utilized to boil the water in the tea kettle if the distance from the stove be too great. Care must be taken that none of the cooling fluid reaches the vessel retaining the distilled water.

Now Smaller Profits in the Business.

From Hugh Chalmers, Michigan.—Considering the great investment and risk involved the returns to automobile manufacturers are not nearly so great as in business where less capital is required and where there is comparatively less risk.

Take the case of the Chalmers Motor Company as a single example. The manufacturing profit on a Chalmers car is about five per cent. of its selling price. How many manufacturers of so-called staple articles would be satisfied with so small a margin of profit?

Politicians and perhaps some portion of the public obtain their ideas of enormous profits from reading reports on big sales figures. Without a doubt motor car sales have increased tremendously, but if they had not, car prices would still occupy the same plane as they did six years back. It would be impossible to incorporate improved features in motor cars each season, reducing car prices simultaneously without a corresponding increase in sales and production.

In practically every instance manufacturers have given the buying public the advantage that has come to them through increased production—in other words, the business has been placed on a profit-sharing basis. I venture the assertion that most standard automobile manufacturers to-day are making less money per car than at any time in their history, but the business continues big because the demand is big.

ADDS 10 YEARS.

To the Man's Life Who Possesses and Drives an Automobile.

From E. R. Erskine, President of the Studebaker Corporation.—It may be difficult to say exactly how many years an automobile adds to a man's life, but I should say that ten years is a fair estimate. There is no gainsaying that the possession of a motor car increases the number of years a man lives, especially if in addition to owning the car the owner drives it himself. For in that way he gets the fullest possible benefits in the way of health.

Of course, there is a certain amount of worry and nervous strain which the novice must undergo in learning to drive his car and to handle it in any traffic situation. However, after a week or two at the wheel this nervousness wears off and then the pleasures and benefits of driving begin to pile up.

After the novice gets his bearings, so to speak, the act of driving becomes automatic in increasing measure. He does not try to climb up on his steering wheel, but sits back in relaxed fashion. I know that from practice I am able to drive my Studebaker car at a good clip without concentrating upon the act of driving. On the contrary, I enjoy the surroundings as I travel along and at the same time get all the benefits of the health and strength-producing exercise attendant upon driving.

The motor car has accomplished almost invaluable results in doing away with a certain species of person known as the tired business man. The individual who once was classed as a "tired business man" is tired no longer; he is alert every minute; his eye has a brighter sparkle; he is alive and keen and responsive.

Figures prepared by the Government Census Bureau certainly show in striking fashion the decrease in our death rate since the automobile came into being; and though we cannot give all the credit to the use of motor cars, still we must not ignore the fact that motor cars have played their part in helping us to live longer.

Let us look at these figures carefully. In 1880 the death rate a thousand was 19.8. In 1900 the rate had gone down to 17.6, and in 1906, with the further increase in the use of automobiles, the death rate had reduced to 15.7. Since 1906 it has wandered still further down the scale, reaching a low water mark of 13.9 a thousand in 1912.

The answer you can find in the above figures—the coming of the automobile has indeed been an

Digitized by Google

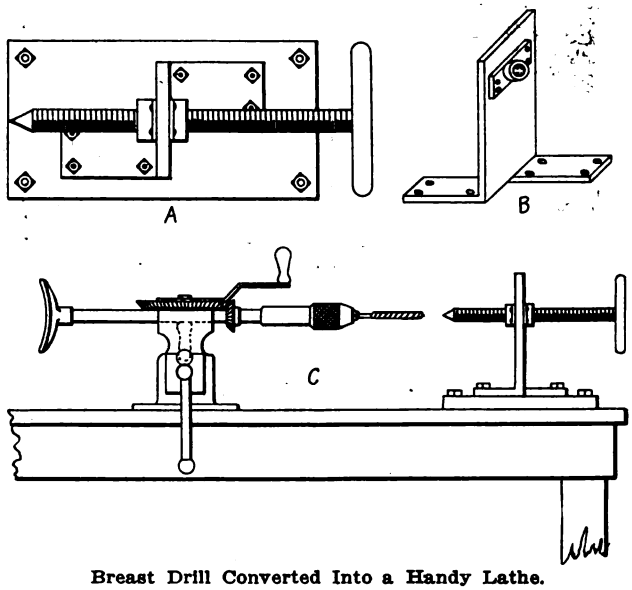
able assistant to the progress of civilization in making a man live longer. Of course it can be realized that as the length of the average man's life increases the death rate decreases. One fact finds its reflection in the other.

The more automobiles in use, the more man gets out into the country and enjoys the benefits of a change of scenery, fresh air and respite from business care. Likewise, the more automobiles the more persons give up time to recreation and relaxation, particularly when no mental strain is involved in operating the car. Automobile drivers give this time to recreation and relaxation largely because they find they can perform their regular daily tasks quicker and better.

The motor car has eliminated distances and has enabled men to live farther away from their work than previously without causing them any inconvenience. It encourages long drives out in the country and broadens and enriches one's experience by opening up new regions—new beauties in nature. It jams good, fresh air into a man's lungs and makes him feel younger each day than he did the day before.

When we list the reasons why the automobile has come to stay we, in justice to its importance, have to name this one and underscore it: The automobile makes a man live longer, and although I am not a physician I should say the possession of an automobile makes a man live at least ten years longer.

Lathe From a Breast Drill.



It is not easy for the owner-repairman to drill a hole in metal without making the opening larger than the diameter of the drill, and in drilling holes 1-64 and 1-32 inch in diameter the small actual cross section of the twist drill makes it an easy matter to snap it. This is due to exerting too much pressure on the drill holder and to inexperience. Drills are also broken when the point just breaks through the metal or when the drill begins to chatter.

If the drill holder be held true as in a lathe, not only is the work drilled accurately but there is less opportunity for breakage. An accompanying illustration shows how a home made breast drill lathe can be constructed, and the equipment is capable of doing such light work as drilling, turning keys to size, refacing valves, polishing and numerous other light jobs. The material required is inexpensive and the average owner can make the tool.

The sketch at C shows the completed drill lathe, also the drill clamped in the bench vise. As the average breast drill is fitted with a spirit level, it is an easy matter to obtain a horizontal position, which is essential for accurate drilling. The tailstock is constructed of a piece of hard wood and a section of 3-16-inch sheet metal. The block should be about one inch thick, six long and about four wide. Assuming that from the centre of the chuck of the breast drill to the top of the work bench is 5½ inches it will be essential to utilize a piece of sheet metal at least eight inches long and four wide.

Take a piece of iron or soft steel, two inches long, one wide and 3-16 thick, and drill four holes at the corners as shown at B. It is advisable to clamp this strip of steel to the large plate before drilling so that the holes of both sections will register. Use rivets and peen over the heads securely. As it is important that the hole bored in the small and large strip for carrying the tailshaft be exactly the same height as the center of the chuck, measure carefully, also allow for the thickness of the wooden block. It is best to cut the metal plate to the shape shown at B, drill the holes and fasten it before taking the measurements previously referred to. The plate can be cut with a hacksaw. If after the work is assembled it be found that there is a slight variation, or in other words, the tailshaft and point of drill do not coincide, the difference can be offset by changing the position of the breast drill in the lathe.

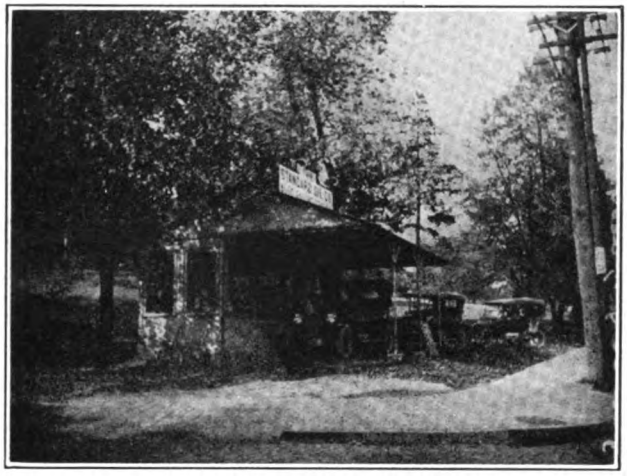
Accuracy can be obtained by placing the drill in the vise, and running the plate against the point of the drill. Prick punch the spot, then drill and tap for a half-inch thread. An exact vertical position of the plate carrying the tailshaft can be obtained by using a spirit level. Upon completing the plate

Breast Drill Converted Into a Handy Lathe.

member, drill four 7-16 inch holes as shown at A, and bolt the wooden block to the bench.

The tailshaft is made of half-inch round stock about six inches long. One end should be pointed while at the other is secured a small hand wheel which should be pinned to the shaft. The tailshaft is threaded and can be locked in position by a nut on either side when using the lathe for turning purposes. It is advisable to use long bolts for securing the tailshaft member to the bench, and if lock washers with wing nuts be employed, the tailshaft can be removed from the bench when not in use. The location of the tailshaft member is optional. It can be located at the right or left of the vise, according to convenience.

The Emergency Brake.



If, in a tight corner, try to collect your faculties sufficiently to remember one thing. Your safety lies in the emergency brake. It will stop you dead—and alive, which is much more important. You may mess your tires up a bit, but that is better than an accident, and no harm will be done to your engine or transmission—which is more than could be said of many cars in case of a sudden enforced stop. When familiar with the car you will never use that so-called "emergency brake" for emergencies; but till you are, remember that it is your "friend in need."

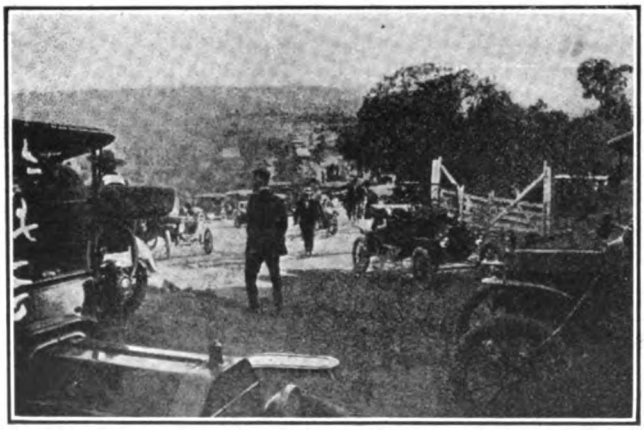
CHEAPER THAN BY RAIL.

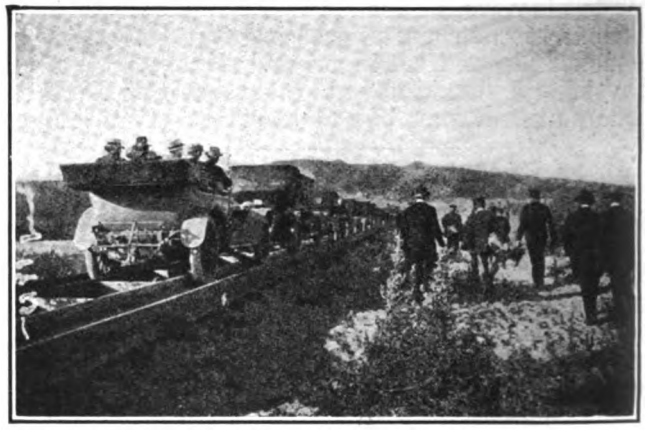


So Every Tourist Goes to Tia Juana by Big or Small Automobile.

From Felix J. Koch, Ohio.—There is probably no other single place in the world where one may see anything anywhere like it, in peace times at any rate. Tens, scores, hundreds—one is tempted almost to say thousands—of automobiles; automobiles

An Automobile Station.

of every kind, class and description; big and small automobiles, cheap and costly; some of them actually made of the second-hand parts from elsewhere and put together by the owners themselves! There are automobiles in that procession which hail from every State in the land. There are automobiles which come to this stage of the journey, which may draw a line squarely across the map of the Western continent and say: "From thence have we come and by most direct route." Nor is the occasion a rare one. All through the winter months, when California is advertised as the one great tourist



Automobile Activity.

land of the West, and has to compete with only Florida and Virginia in the country at large, you will find a repetition of this array of motorists.

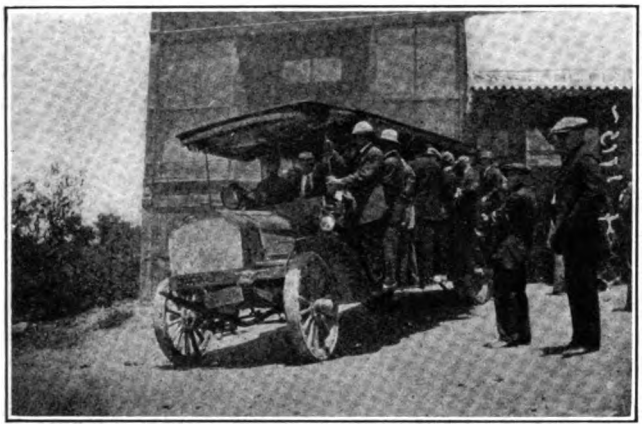
All through the summer, now that the great expositions of California have served to show a doubting country, as well as folks of the Dominion of the north, that even in mid-summer southern California is not over warm, one may look for these motorists just so long as revolution does not wage its battles so close to the American frontier as Tia Juana, and the weekly bull fights held here are properly advertised in San Diego and beyond.

It is a triteism of American travel that no self-respecting American goes to see a second bull fight. It is, however, also a most certain gamble that every American goes to see a bull fight at least once, if at all within range of such affair. Even to those with whom the sport is most revolting it sounds big, and it gives the proper touch of appearing "travelled" to be able to say on one's return—most unconcerned, of course: "Yes, we motored down into Mexico, and attended one of the big bull fights," and adding hastily, as if apologizing for going, "of course, I'd never go there again." The result is that every time there is to be a big bull fight in Tia Juana, and that means just about every week at least, the fact is duly advertised in newspapers, by bill boards and in the hotels and other places, over all that section of California lying southward of San Francisco—in other words the territory from which tourists might reasonably expect to come.

Not that all of these come all the way down from the north simply to see the bull fight, but they want to see Los Angeles and San Diego and go over to

Single File Only.

Coronado. They want to visit Oldtown, the home of Ramona, and they might cross the line as well.



And so they come in perfect caravans, these motorists. The roads leading to Tia Juana are fairly choked with them. Each automobile as a rule bears its full quota of people, strangers often aboard as well, who beg a lift on their way, as the trains are so full they cannot accommodate them. These are most convenient guests as they pay the toll for the automobile as it passes over the toll bridge and beyond the line. It is at the toll bridge that one sees the string of automobiles at its best, crossing to Mexico. The bridge is but a single roadway, and so the motors must travel in single file. As each is halted for toll there is a bunching up of the machines behind, and as it consumes the same amount of time for each to pay their toll, and as they must still keep to that one road, they take definite spaces in an endless line that travels slowly toward the hills. The toll bridge is a private affair and it pays well. An automobile of any description with a driver pays 20 cents. Every additional passenger pays 5 cents. Of course, it often takes some little time to count the folks aboard, especially when it is a big touring car, but the company gets every nickel, rest assured, and until it does, the automobile doesn't go on. The construction of the bridge is such that there is no diverting or getting by

Digitized by Google

while the gatekeeper is not looking. You enter upon two substantial runways, as to a garage entry. You find these flanked with little edgings too high for the automobile wheel to raise itself across, even if it cared. Between the runs there is only open space, with its criss-cross trestling, and you stick to the path, or tumble into the deep.

Arrived at last at Tia Juana, the automobiles park on the plaza and it is only as you see them in endless rows that their actual number is brought home.

Motoring across the border may hardly be accounted among the listed sports of the American.

Costs Less Than By Rail.

Taking the country generally and recalling how revolutions have caused Americans to fight rather shy of Mexico of late years, whatsoever may happen along the line between the two republics, it is certain that no place can take greater rank as a center for all types and makes of automobiles than the little bridge of solid timbers.

SIX, EIGHT OR TWELVE.

Cylinders May All Be Good, but They Can't All Be Best.

From R. H. Collins, Buick Motor Company.—If the advantage of the six-cylinder motor had to be defined in one word that word would be "balance." Makers of six-cylinder motors contend that this type of power plant yields the maximum of smooth power that can be obtained without the necessity for more or less costly mechanical sacrifices.

Theoretically, of course, the smoothness of the power developed by a motor increases as the cylinders are increased in number. Makers of sixes contend, however, that beyond a certain point this extra smoothness of power has no significance to the average motorist. They argue that for all practical purposes the six-cylinder motor supplies power that is smooth enough to be defined as practically liquid in its flow.

The Buick Company contends that in the present stage of engineering development to go beyond six cylinders would involve a mechanical complicity and expense which would not be warranted by the advantages gained.

The Buick Company also takes the position that the six is the logical motor, from the standpoint of public favor as well as the standpoint of mechanical efficiency. Since the announcement that all Buicks would be six cylinder models the company has been swamped with a demand for its product.

The Buick Motor Company received thousands of inquiries after its "sixes exclusively" announcement asking why its output would be confined to that one type. The reply in each instance was to the effect that the six-cylinder motor offered the greatest possible motor smoothness and balance that could be built into a motor of simple construction.

"Eight Will Be Permanent Type."

From Edgar Apperson, of Apperson Brothers.—There are many mechanical reasons why the eight-cylinder design will find an always widening market. I do not mean that this type of motor will supplant the four and six, but that there will be a demand for all three types—fours, sixes and eights. They are all dependable, and give satisfactory service. The choice depends upon the degree of speed, comfort, flexibility and ease of control the motorist wishes to enjoy.

Each type of motor has its advantages. The six will do things that cannot be expected of the four, and the eight has characteristics which you must not call upon the six to perform.

The building of an eight-cylinder motor is not entirely a new thing, for in Europe engineers have been experimenting with it for years. They had not, until lately, become practicable, for the reason that it was necessary to overcome many difficulties, the chief one being inadequate oiling systems.

The two most important features of eight-cylinder performance are: First, flow of power, and second, flexibility.

The eight gives you four power impulses for every revolution of the flywheel, an impulse every quarter turn. The overlapping is so complete that the turning effort is practically constant. The eight is the ideal power plant, for there is no hesitation between impulses.

In eight-cylinder construction there are honest reasons for using the word flexibility. For there is a degree of flexibility enjoyed, never before thought of with the use of any other type of gasoline motor.

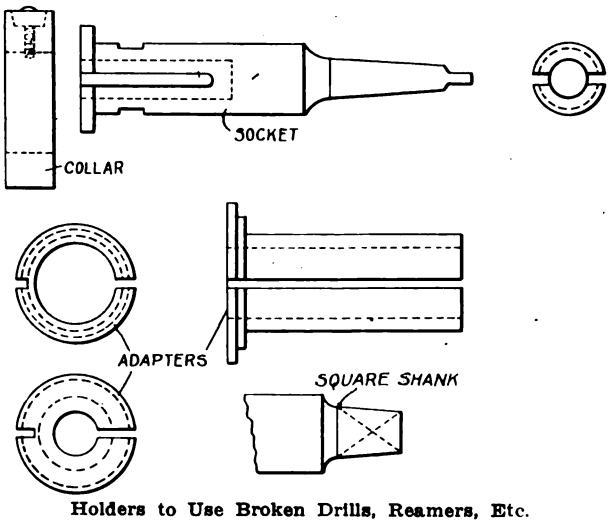
Now for the Twelve.

From F. N. Nutt, Chief Engineer of the Haynes Automobile Company.—In considering the advantage of any car or motor from an engineering standpoint there are two sides to consider. The designer and his helpers are to be thought of on one hand, while the manufacturer makes up the other side. In other words, the engineering staff of an automobile first must work in harmony with the manufacturing side if good results are to be obtained.

Twelve-cylinder construction is an advantage to the manufacturer as well as to the buyer, because larger quantities can be produced more cheaply. Nearly all parts on this type of engine are considerably smaller than when used on the motor of a less number of cylinders. This means that the expense is less for each part. Also in machinery, parts can be handled cheaper because of the smallness in size. In assembling the decreased size of parts brings about more despatch because they can be handled easier and faster. Because of the smallness in size larger quantities of parts can be handled, giving a more efficient production.

In the design of twelve cylinder motors various valve arrangements have been made. In most cases

Digitized by Google



the T-head motor has not met with consideration. The L-head has been used in two ways. Some have arranged the valves on the outside, which necessarily requires two camshafts, besides adding width to the hood. Other users of the L-head twelve-cylinder motor put the valves along each side of the "V" alleyway. This arrangement requires only one camshaft, but it adds complications and inaccessibility.

In the valve-in-head motor the valves are accessible for inspection at all times and require only the removing of a cover plate to watch their action and for adjustment of springs. Only one camshaft is required with the valve-in-head arrangement.

Another distinct advantage has been gained in twelve-cylinder motor construction because of the increased number of power impulses. Naturally piston displacement has been increased, but not to such an extent that power is wasted. A decrease in bore and stroke brings the added displacement down so that only a little more than the added friction is taken care of. Therefore, the motor while sufficiently satisfying the demand for more power has an added effect of always producing a harmonious flow of power. This, coupled with lightweight construction, should surely satisfy the popular demand.

A Useful Drill Socket.

As a rule broken drills, reamers and similar tools are discarded. If considerable work be done the cost of replacing the tools amounts to quite an item in the course of a year and reduces the profits, for

Holders to Use Broken Drills, Reamers, Etc.

the wear and tear of repair shop equipment can only be charged to overhead expense, not to the customer.

The accompanying sketch illustrates an easily constructed drill socket that will be found to be useful for holding straight shank and broken drills, reamers, etc. As may be noted, it is so constructed as to be used with adapters, thus permitting of the use of drills of various diameters. The adapters are turned from cast steel, and can be made up with a tapered shank on a square section member, making the latter adaptable for use with a ratchet brace.

The holder has a recess bored in it, as shown by the dotted lines, and this construction adapts it either for the fitting of the shank of a drill or to take the various adapters. A loose collar fitting the outside of the holder is drilled, countersunk and tapped to take a square headed set screw. When this collar is slipped over the head of the holder, and the screw set up snug, the last named presses against the holder, causing it to grip either the drill or one of the adapters.

The adapters are best when constructed of mild steel and as many can be made up as required. They are completely divided at one side, and partially slotted at the other, this being necessary to allow them to contract or grip easily when pressure is applied on the outside holder. The slots of the adapters should always coincide with those of the adapters.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

1751 **Many Inquiries.**

From Chas. W. Finney, Indiana.—1—How may the exhaust pipe and exhaust manifold be cleaned of carbon deposits? 2—How may a Holley carburetor be disassembled? 3—What is "Prussian blue" and "Persian red?" Are they paints? 4—In disassembling the transmission of a Ford, is there much danger of not getting it back together right? 5—What do you think of installing electric lights on older model Fords, to run from the magneto? 6—Is there any way to remedy scratches on the cylinder walls, other than regrinding? 7—How are the main bearing cap bolts in a Ford kept from working loose? 8—Is it safe to use ground cork in differentials to prevent noise made by worn gears? 9—How may the water passages in a motor be cleared from rust and lime? 10—There is a buzz in the gearing in my Ford when running from 20 to 25 miles an hour. I think it is in the differentials. Can you tell me why it is at that speed only and what is the cause?

Reply.—1—Boiling in water in which soda ash or washing soda is dissolved should soften carbon deposits. It is possible that soaking in kerosene might answer. 2—By removing the holding screws and float lever fulcrum pin. 3—They are pigments used for coloring paints largely. 4—Practically none. 5—Seems to work out satisfactorily providing the magneto itself is in proper shape. 6—We know that regrinding will remedy this condition, but if there is any other satisfactory remedy we do not know of it from experience. 7—Nut locks and cotter pins are both used for the purpose of preventing loosening of nuts where there is much vibration. 8

Digitized by Google

—Yes, if there is no danger of filling up oil grooves and holes, but safest to put in new gears. 9—By using water to which muriatic acid has been added, rinsing out carefully and exercising great care that the water and acid mixture does not come in contact with any bright parts, and after having cleaned out the lime deposits use thereafter nothing but rain water in your radiator. 10—No. It may be caused by the gears being off the true pitch line, due to wear of the driving shaft bushing, resonance or some other cause. Whatever it is, it should be remedied.

1752 **His Regal Ignition System.**

From Harley Graston, Indiana.—My car is a Regal 39 horsepower, 1915. Is there a magneto made that can be put on the car for ignition? I want to use the storage battery for just starting and lighting.

Reply.—This model, as we understand, was designed to use a well and favorably known complete system of combined ignition, starting and lighting, similar to that in use to-day by a good many thousand cars. Where there has seemed a demand for magneto ignition on such cars magneto manufacturers have in certain cases devised magneto ignition systems which could be installed. The manufacturers of the Regal car could best advise you, if they would and we see no reason why they should refuse except they cannot see why you are seemingly dissatisfied with what is generally accounted as about ignition perfection.

1753 **Batteries and Tire Chains.**

From I. O. Ernest, Ohio.—1—My car is a 1915 model T Ford roadster. I wish to install some dry batteries to assist in starting from seat with a "hand starter." My car starts rather hard and have been told that batteries would give a hotter spark. The carburetor floods after the second priming which causes considerable annoyance. Is there any advantage in starting on battery rather than on magneto? 2—Please state number of cells required and about how many miles the required number of cells to form a battery would last, running continuously on battery in place of magneto. In other words, I wish to obtain an idea as to how much it would cost to install and maintain a battery for either starting or emergency use. 3—Does a battery deteriorate when not in use? 4—How should the battery be connected up, and where should ground be made, if at all? 5—In putting on Weed tire chains should the opening of cross chains be toward the tire or ground? If toward the ground this brings the sheet metal clamp on coupling next to ground also, thus: Have had trouble with chains throwing off recently caused by opening of coupler. Kindly advise proper manner of installing a chain from which information I may be able to remedy the difficulty I have experienced.

Reply.—1—At low speed as in starting, a hotter spark may be obtained from battery than from magneto. 2—Six cells, but no one on earth, not even the best informed electrician or manufacturer of dry cells, could tell for how many miles a battery of dry cells would furnish ignition, especially when used in connection with vibrating coils, for the reason that there are many conditions of adjustment as well as cell construction, size and quality of chemical ingredients to be considered. You will find it an ultra expensive system, one abandoned by every motor car manufacturer. On the other hand there were many thousands of cars turned out last year with battery ignition systems, but every one of them used the so-called "single spark" systems and practically every such installation proved eminently satisfactory. 3—Yes. 4—In series, that is the carbon of one cell connected to the zinc of the next, etc., and one pole grounded to the frame of the chassis and the other connected to the battery side of the switch. 5—Usually towards the ground. Chains will not throw off unless they are too long and are too slack upon the shoe.

1754 **His 1909 Buick.**

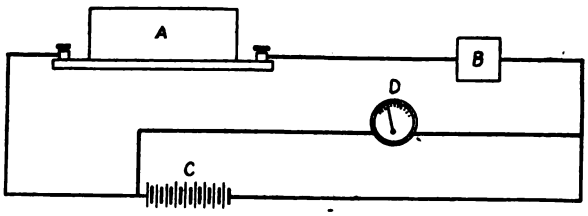
From G. S. Day, New York.—1—I have a model 10, 1909 Buick, and would like to know if I can change my water system into syphon system and how to do it. Mine is gear type. 2—Also please tell me what steel is the best to use for making new valves and stems. I want to use the best from every point.

Reply.—1—We fear you will not be able to transform your water circulation system as you would like, for the reason that your radiator would not be of sufficient capacity and in general the jackets, connections, etc., are designed for mechanical rather than thermo-syphon or natural water circulation. 2—Nickel steel is largely used for this purpose, while tungsten steel is also used to a considerable extent. When the latter steel is used the valves themselves cannot be reground in place, the valve seats having to be ground to the valve faces. Both steels have advantages. You will note that we have been careful to refrain from expressing our views as to the superiority of either steel. Some prefer one and some prefer the other. Nickel steel mushrooms welded to machine steel stems give good satisfaction. Nickel steel is much more easily machined. Vanadium steel has some good features. You can buy new valves ever so much more cheaply than you can machine them, providing they are for any standard model of motor.

1755 **His Two-Cylinder Maxwell.**

From C. E. Caswell, New Hampshire.—I have a Maxwell runabout, two-cylinder, model AA, which is probably three or four seasons old, but has been kept in fine condition and up to about a month ago has run slick as oil. The motor starts all right and apparently runs O. K. when the car is idle, and on low; but when thrown into high it will run for thirty or forty rods and commence to fire back through the muffler, and the power die down until have to shift into low, until the motor speeds up again, then change to high and it is O. K. for a few rods more, possibly quarter or half a mile sometimes. I have readjusted the carburetor probably a thousand times, and finally set it where it has been for a year or more and here it appears to do the best. Have drawn out the gasoline from bottom of carburetor, taken feed pipe out and drawn out gas from bottom of tank, and in fact done everything I can think of, but do not hit on the proper adjustment. It appears as though there might be dirt in the carburetor, but there is not. The motor starts on batteries and acts the same when running on magneto. Have ground the valves and changed the plugs several times. Platinum points are badly

Digitized by Google



worn, but have smoothed them up. The car will run low but not on high is the long and short of it.

Reply.—Your Maxwell runabout is considerably older than three or four seasons, for it is several years since the Maxwell-Briscoe Motor Co. abandoned double-opposed motor design. Without any doubt your inlet valve stems and bushings are so badly worn that air leaks cause such a lean mixture at low engine speed that ignition cannot take place regularly. Your remedy is probably new inlet valves with larger and better fitting stems, or possibly you can use inlet valve stem bushings which fit more closely.

1756 **Electric Starter Trouble.**

From K. Dorion, Massachusetts.—1—I have twice broken the chain on my General Electric starter, on my Ford car. Can you let me know how I can prevent this? 2—Will you let me know how to wire an electric meter, in order that I can see the charge and discharge of the battery.

Reply.—1—It is possible that you have tried to start the car with the ignition set too early. This chain is certainly sufficiently strong for the purpose if given a reasonably fair chance. It is also possible that your reverse band may drag or that your motor starts much harder than it should normally. 2—You should connect an ammeter in

the circuit, one pole connected to the wire leading from the storage battery to the circuit breaker, and if the system is the grounded or single wire the other pole could be grounded. If the other pole of the battery is connected by wire with the generator, the other pole of the ammeter could be connected to it. In either case you might connect the other binding post on the ammeter to the storage battery terminal marked—or "Neg." In the illustration A represents the generator, B the circuit breaker or relay, C the storage battery and D the ammeter, in a system using a wire return.

1757 **Clutch Trouble.**

From J. P. Roche, Connecticut.—I have a question to ask in regard to my Ford car, which has been driven about 12,000 miles. For the past six weeks when I push in the clutch to start, there is a sort of catch and grinding sound, which seems to come from the transmission case, but I know sounds will travel from the rear. I asked a garage man about it and he said I had a poor pinion, or my clutch band was too tight. I had a new pinion put in about three months ago, and have tried the clutch at all adjustments it would work at. I am a rural carrier and average 100 stops daily, but have not used the car for two weeks, the roads are so bad.

Reply.—It may be that new bushings in the transmission gears will remedy the trouble, although it may be that the bushings in the differential may be badly worn, allowing the gearing to run off the pitch line. If you will block the rear axle up so the wheels clear the floor you should be able to tell whether the trouble is in the differential or transmission by turning the wheels by hand. Where one makes 100 stops a day almost anything is likely to happen to clutch or gears.

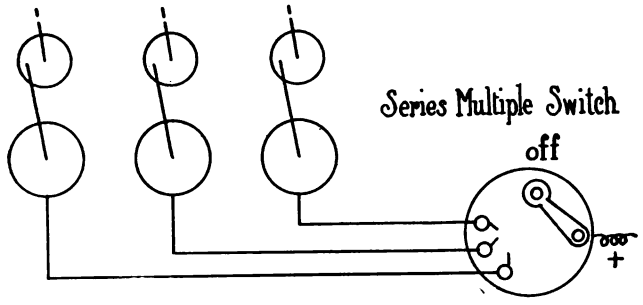
1758 **Valve Timing.**

From A. C. Kidwell, Washington, D. C.—I desire information as to timing the valves on a four-cylinder motor, firing 1—3—4—2. I have ground in the valves and thoroughly removed all carbon. Previous to grinding, one cylinder occasionally missed and I was of the impression that a dirty valve was responsible for this. Since grinding, however, the same trouble exists. While I had the head off my motor, I checked the timing of the valves by the marks on the flywheel and also noted that the valves worked in proper sequence, but am not certain that the valves closed just at the proper time. For instance, on the suction stroke, the intake valve opened when the piston had descended about an inch from the top and the exhaust valve started to open when the piston on the working stroke was about an inch from its lowest position. The valves operate the same way in all cylinders. I tested the spark in each cylinder and found that it reached the cylinders when the piston was in its highest position on the compression stroke. After replacing the head on the motor, I started the engine and it worked fine for about five minutes, not a cylinder missing; then it began to miss and no adjustment of the needle valve on the carburetor will make any improvement. I have so much compression now that it is difficult to turn the motor over, notwithstanding the fact that it is only 15 H. P. I have a 1914 Saxon roadster fitted with a Continental motor and Mayer carburetor.

Reply.—You can be reasonably sure that the manufacturer of your motor knows when the valves should open and close, and that the markings on the flywheels are correct. Late inlet valve opening is to give the gas a high velocity during the induction stroke of the piston and also to minimize possibility of "back fires" through the carburetor. Early opening of the exhaust valve is necessary in order to have the valve fully open at the end of the power stroke, else the motor would lose power at high speed. You will probably find a leak between the inlet valve stem and bushing which admits air to the bothering cylinder, or an exhaust valve spring weaker than it should be. A bent exhaust valve stem will cause symptoms such as you describe. Of course you have noted whether or not the plug in the troublesome cylinder "fouls" more quickly than in the others, an indication of poorly fitting piston or rings.

1759 **Batteries for Lighting.**

From W. L. Woodfield, Indiana.—I have the Presto lighting system but would like to change to electric, if practical to do so, using dry cells. Will 6 C. P. lamps light the road as well as the 3-4 foot gas burners with 5-inch mirror lense reflectors? Or can I use 12 C. P. lamps on dry batteries? I intend to use this set of batteries for the head lights only. How many cells will be required for the 6 C. P. lamps? 12 C. P. lamps? How will these be connected, series or multiple? Which size will be most economical, No. 6 or larger? Using



Digitized by Google

lights 4 to 6 hours per week, how many light hours will a set of dry cells furnish? What will be voltage of lamps? Will the lamps be connected in series or parallel? Will a set of dry cells furnish any more light hours when the lights are turned down by means of a dimmer than when they are on full?

Reply.—Your inquiries concerning the life of dry cells are rather hard to answer, for manufacturers of dry cells would hardly care to attempt to answer them. You can take it from us, and seriously too, that the present high cost of dry cells, due to the prevailing high cost of black oxide of manganese which has to be used in their construction, utterly puts the use of dry cells "out of the running" for the purpose of headlight illumination, on account of the terrific cost of such illumination even when using 6 C. P. lamps. It would be a modern Croesus who could afford to use 12 C. P. headlights with dry cell battery current supply. Of course the slower the discharge the longer dry cells would last. Probably six parallel series of four each, a total of 24 cells, would be the most economical in the end, although if not used a great deal, not over 4-6 hours, there would be likely to be a considerable loss of current when the lights are not burning. Four dry cells in series would necessitate the use of 6-volt lamps in parallel. If the dimmer is so constructed that the voltage at the battery is lowered the current consumption would be less, but if resistance is interposed the consumption of current might be the same both with and without the dimmer.

Triple Contact Switch.

From Charles E. Duryea, Pennsylvania.—Mr. Walker very correctly points out a source of loss

Wiring Diagram.

that often destroys dry batteries when connected in multiple series. See last paragraph of his well written article in the November issue. Mr. Shattuck also refers to the multiple series method as being best and cheapest. That both of them should favor this arrangement and one of them point out the fault and neither of them suggest a remedy seems to call for a word to the effect that the loss can be avoided by the use of a switch having a triple contact post. Instead of connecting the three series to one wire, let a wire from each series run to the switch and there terminate in a binding post from which a slightly elastic finger extends to the spot where the switch lever is supposed to contact. When the switch lever is on it contacts with all three of these spring fingers, and their combined current is carried where wanted. But when off there is no chance for a circuit back through the next battery series, for all three are separated at the one end. The sketch makes this plain.

Useful Electrical Information.

From A. W. Clinton, New York.—In charging storage batteries for lighting and starting automobiles, it is necessary to use a direct current, and connect the positive pole of the charging current to the positive pole of the battery, or the battery would be ruined. Therefore, it is necessary to find out which is the positive pole of the charging current. If a wire through which a current is flowing is held in a north and south direction, and a compass is placed over the wire, if the north end of the needle is deflected to the east, the positive pole is the south end, but if the north end of the needle is deflected to the west, the positive pole is the north end of the wire. If the compass is placed under the wire the reverse is the case. An alternating current cannot be used in charging a battery and has no effect on a compass. An automobile that is electrically started by a single unit, or a motor generator, cannot have an ordinary ampere meter placed in circuit to indicate whether the battery is being charged or discharged, as the current used in the starting is so strong it would burn out the meter, but a little compass will indicate whether the battery is being charged or discharged. If a compass is placed over the positive wire running from the battery to the motor generator when discharging, the north end of the needle will swing to the right, and when charging to the left. The strength of the current is indicated by the amount of the deflection of the needle. A weak current deflects the needle only slightly. A strong current causes it to stand at right angles to the wire.

I have recently placed one on my car. I have a Dyneto-Entz motor generator. I could not conveniently place the compass over the large cable running from the battery to the motor generator, so I took an insulated copper wire about one-sixteenth of an inch in diameter and attached one end to the positive pole of the motor generator and brought it back to the instrument board, where I had placed a block with a hole bored in it the right size to set the pocket compass into. I looped the wire once around the compass to intensify the action of the current and attached the other end to the positive pole of the battery. I did not know how it would work—dividing the current between the cable and the wire—but found it worked perfectly, and indicated the current as well as could be desired. The compass should be set level, and I painted the north end of the needle red and the south end white, to be seen more easily.

As I had the pocket compass and the wire the indicator has cost me only the pleasure of putting it on and having it work satisfactorily.

Suggestion for Signals.

From William A. Robbins, New Jersey.—As I have driven about and noticed the various and often careless ways in which drivers hold out the arm to indicate turning the corner, it has occurred to me that we might adopt a uniform custom. I suggest that the arm should be held down to indicate a turn to the right and held up to indicate a turn to the left. I select these motions for this reason: the turn to right is not so dangerous to others, therefore I would indicate it with the less emphatic motion down—the turn to the left frequently interferes with traffic and should be announced by the raised arm, a conspicuous signal. To complete the series,

Digitized by Google

the arm could be held extended horizontally to indicate a slowdown or stop. These signals would serve as well for a left hand as for a right hand driver.

Interesting Experience.

From William Thomas, New York.—I have been running my E. M. F., 30, car for a few years and do a heavy passenger business in the Catskill mountains. Here there are nothing but steep hills and I am on the road day and night. I have a run which I make every afternoon in the summer months of 72 miles, round trip, and run heavy trips in the morning and take out joy riders at night. I have carried at times 7-passenger loads in my machine. I have never had any engine trouble since I bought the machine and have never had to stop for any kind of trouble, except with tires, and that is the least thing that bothers me. I get big mileage out of the tires I use. I might buy three in two seasons. I am using two tires now that I got a year ago last Spring, and you can see the prints of the "Non-Skid" yet. They are a Miller and an Ajax 32 by 3½, and I have one on my front wheel, which is a Morgan & Wright. They came out of the factory on the car in 1912. The other night I took five prisoners and an officer and myself over a rough frozen road of 65 miles. It was snowing hard and we did not stop for anything. This Morgan & Wright tire that is running now I discarded once after getting 2,000 miles out of it, and last year I thought I would use it again, so I put in a blow-out patch, a different inner tube, and although my wife said I might as well throw the tire out of the garage, I made good use of it. I split the tube in the center all around, washed it with gasoline, and did the same with the tire, using an old razor to cut all the high places off the shoe so it would be smooth. I gave each two coats and with a little help stretched the tubing from bead to bead and pressed it in. To look at it now you would think it had just come from the factory with a new white tread. I have had 829 miles use from it. I try experiments of this sort and always come out ahead. Some time I hope to write you about my experience with my magneto. Garage men could not solve the difficulty with it, but I put it in condition myself and saved $20. My car has only been in the garage once and then only two hours, and I stayed and watched it so that no funny work could be done.

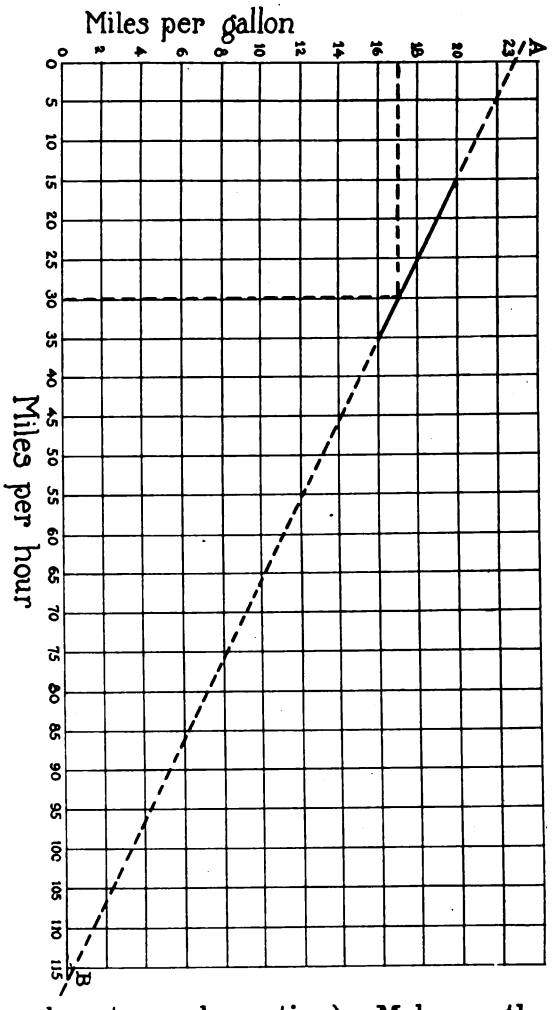
Valve Cap Fit.

To obtain a perfect joint under a valve cap care should be taken in the first place in unscrewing the cap. A suitable spanner should be used and not a hammer and punch, as is often the case. When the cap has been removed the threads of the cap should be carefully cleaned, and also those in the cylinder head, to remove all carbon, burnt oil, etc. Then examine the lower face where the joint is made with the cylinder casting, and it will possibly be found that the cap has been distorted or burred by hammering up at some time; if so, true the face carefully with a file, or, better, in the lathe, so that the cap, minus the copper washer, will screw quite home, true all round. This is important, and the cap should be tested with a feeler gauge or a smear of red lead and oil, or even paint. Now take the copper washer and make it red hot in any convenient manner—just dull red—then cool it out in water, and wipe it clean. This softens the washer, and both new and old ones are better for this treatment, the asbestos suffering no harm. The threads of the cap should now be greased; if possible, use a graphite grease, as this ensures the plug being readily removed subsequently. A smear of graphite grease should be placed on the faces of the washer also, and the cap screwed firmly home. Do not use too much grease on the threads, and on no account allow gold size, or similar compounds, if used on the joint, to get on to the screwed portion of the cap.

Touring in Canada.

From Canadian Motoring.—Removal of the restrictions placed on automobile touring by federal and provincial regulations has long been one of the chief objections of the Ontario Motor League. The refusal of the Ontario government to recognize United States automobile registration has been the principal factor in deterring automobile tourist travel. The other deterrent has been the customs regulations requiring all tourists bringing foreign-built cars into Canada to provide a guarantee bond if the cars are to be used beyond the limits of the port of importation and vicinity. These have been the two chief obstacles to motor touring in Canada on the part of United States citizens. But the motor tourist may now spend ten days in Canada and return to the United States by any port at the end of that time, without being compelled to furnish a bond. In the Province of Quebec, where license exchange has been in effect for some time, United States motorists have now practical freedom in touring, but in Ontario the automobile license obstacle still remains. The United States motorist who wishes to spend even a day or an hour in Canada must pay a full year's license fee. It is apparent that such a regulation must deflect automobile tourist travel from Ontario to a large extent.

It is to be hoped that the removal of the customs barrier due to the recognition by the Federal government that automobile touring should not be discouraged, will furnish an example to the Provincial government to remove the other barrier which license exchange places in the path of automobile touring.



Due to the Carburetor.

From A. R. Campbell, Kentucky.—What is the matter with my car? Do I know, well I should say so. It got so it did not run good. The carburetor got worn, so I traded for a new one. My car was an Elmore, two cycle. I put on the new carburetor. It ran fine, but did not have the hill climbing capacity it formerly had. I used the new carburetor about one year, and the speed gradually decreased. I had new piston rings put on, and the car made still less progress. It would formerly make 50 to 60 miles, but it become so reduced I could not make over fifteen miles. After all improvements failed I figured it out that the carburetor did not produce enough gas, and for a final trial I concluded to buy another larger carburetor, so I ordered a new one, and to my utter surprise my old car would simply pass every car in our city, including Fords, Maxwells, Buicks, Empire, Dodge, Pullman and Franklin, just simply go right around them; don't know how fast I could go because of the speed limit. In conclusion, if your car will not run look up the faults of your carburetor.

Digitized by Google

Gasoline Equation.

From M. G. Near, New York.—To find how much gasoline your car uses when traveling at any given rate of speed, first lay off a square map like the illustration, or you can use this same one which is already laid off. Horizontal distances represent miles per hour, and vertical distances miles per gallon. Let us suppose that when you travel at the uniform speed of 15 miles per hour you find that your car will go 20 miles on one gallon. Make a dot opposite the 20 and over the 15, just as I have done. And again, when you travel at the uniform speed of 35 miles per hour you find that your car will go 16 miles on one gallon. (These values are

pretty close to good practice.) Make another dot opposite the 16 and over the 35. Now draw a straight line through the two dots and extend the ends until the line cuts the vertical and horizontal lines at A and B. That's the end of the drawing job.

You will note that Point A is cut at 23, and point B at 115. To find the miles per gallon at any ordinary speed, now, multiply the figure at A by the speed in miles per hour and divide by the figure at B, and then subtract the result from the figure at A. For example, how many miles per gallon will the car go when traveling at the rate of 30 miles per hour? Solution: (30 times 23) divided by 115 equals 6. 23 minus 6 equals 17. Therefore, 17 miles per gallon. You will note that 17 lies exactly opposite the point on the AB that is cut by a vertical line from 30. The problem is therefore "double checked."

MR. DURYEA COMES BACK

With Vigorous Words in Favor of the Two-Cycle Motor.

From Charles E. Duryea, Pennsylvania.—Your disposal of the 2-cycle matter doubtless seems to you and to many as a fair one, but I trust you will pardon me for being certain that it is not. Having once been as much prejudiced against the 2-cycle as any one has a right to be, and having learned the error of my thought, I feel that I am better qualified to speak than most men. The array of authorities cited looks formidable, but knowing personally three out of the four, I know that they were not so well acquainted with the 2-cycle as they should be to-day or doubtless would be if writing to-day. So rapidly does the auto business grow that a book written five years ago can hardly be considered authority.

Nor do your short quotations present correctly the facts found in the books quoted. Please do not think me to insinuate that you had any thought of coloring the testimony by selecting only that which favored your views, but that it is not possible to give all the facts in a short quotation or two. For example, Hiscox only gives credit for superiority to the 4-cycle in the "larger power units" and says just two pages earlier "At the present time it (the 2-cycle motor) has an equal standard value as a motor-power as its ancient rival, the 4-cycle."

The error we moderns make is that we compare the cheap and nasty 2-cycle boat motor with the highly developed auto motor of the 4-cycle type and quite rightly pronounce in favor of the latter. Most of the writers on the subject having nothing else to compare do likewise. But any fair minded man will admit that this is not fair nor likely to lead us to that better form we all desire. Nor is it correct to say that the 2-cycle was tried and "found wanting." You ask of the Elmore and Knox Atlas. I once asked, "What did the Elmore people sell out for?" The answer came at once, "For $800,000 in two drafts. I saw the drafts." That was reason enough for me. A man prominent in the strong combination that bought out the Elmore connected himself with another high-grade 2-cycle car and it ceased using a 2-cycle motor. A company connected with that combination tried out the 2-cycle motor and was so pleased with it that it built a hundred or so cars. Then, for a reason not known to me, but easily guessed, they scrapped the entire lot. Another company in that same combination tested out a 2-cycle car and seemed pleased but changed its plans and dropped the matter. It seems a safe assumption that the 2-cycle looked dangerous to their interests and that it was but good business to suppress it so long as a growing market for the 4-cycle existed.

The Atlas had a bad odor following it. Its ports were badly arranged and its crank bearings were of the roller type and without packing. Doubtless air entered the crankcase and vitiated the mixture which, coupled with the bad port action, caused it to be wasteful and smelly. Chase built up a splendid business on a motor that was both 2-cycle and air-cooled.

Your reasoning is not final. Twenty years ago the gasoline motored car swept the field. There were no electrics or steamers to compare with it. Yet the people wanted electrics and failing to get them, took steam. It took seven or eight years to

Digitized by Google

get them to see the advantages of the combustion motor. And some of the oldest and best informed makers of gas cars wondered if they ever would see. Side entrance surreys were one of the early forms, but the rear door tonneau wiped it off the map and people could well have said that the side entrance four-passenger body has been tried and found wanting. Left side drive was used on the Knox and Autocar vehicles and on some others. Central (either side) on the Duryea. But the right drive won the day. No sooner was it fully established than again the wind of popular favor changed and left side now predominates.

Steel wheels were fitted to the majority of the cars of the first years of the century and then later gave way to wood. In far better design they are again applying for recognition. Dare you to say they will not come back? Yet they were "as extinct as the proverbial Dodo."

The matter cannot be settled on any such grounds. Merit is immortal and no matter how often downed the good thing will eventually win. A well designed and well made 2-cycle need not hide its head before any other design. It is simpler and lighter. It is cheaper and has more impulses. It needs less repairs and is longer lived. It cools easier and may be more economical. Most people will grant the above claims until they come to the last two, but they are easily explained. It holds the hot gases only 125 degrees out of 360 degrees, whereas the 4-cycle holds them 360 degrees out of 720 degrees. It has no idle pistons and no camshaft friction. All its power can go into work. Many of the largest engines are 2-cycle. Don't let prejudice hide its merits.

(Note by the Editor.—Mr. Duryea's natural and acquired knowledge of automobile construction and engineering is as wide as that of any living man. But we fear he may also know some things that are not so. The strongest argument he gives in the foregoing communication as to the superiority of the 2-cycle motor is that simply because things have been discarded and afterwards improved and successfully taken up, 2-cycle motors will also be successfully employed. But this is a rather negative argument. One may as well claim that because many more things have been discarded and not again taken up, the 2-cycle motor will not again be successful. The writer of this has no opinion about this motor nor anything else that he will not gladly exchange for the truth and the facts, and we have merely tried to secure the truth and the facts rather than to prove that the motor is or is not superior for automobile propulsion to the 4-cycle motor. Meantime, nothing stands in the way of making the 2-cycle engine successful—unless it be itself. The field is open to anyone who cares to enter it, and may he be successful.)

Defends Mr. Duryea.

From C. L. von Berg, Nebraska.—In the November number, under the heading, "Two Cycle Engines," was printed a splendid article by Chas. E. Duryea on the possibilities of these engines and on another page appears an article, by the editor, I presume, in which he quotes various authorities to bear him out in down-crying this form of engine.

The editor, very carefully evades contradicting Mr. Duryea on what he has said about the merits of air-cooled engines, and I dare say could get about as poor a recommendation from these same "authorities" for an air-cooled engine. For, "they have been tried and found wanting."

The fact remains that there is, and has been for many years, an air-cooled engine, which in point of dependability, economy and about every thing else that is good, is so far ahead of any water-cooled engine that there is no comparison. Mr. Duryea says there is a successful two cycle engine, and I think he is the designer of this engine and that it is also air-cooled. If this is true, as he says, what has been done, can be done again. If certain makers have failed with a poorly designed air-cooled engine, or one of two cycle design, it does not prove the principles wrong.

Or, if they have been discarded by ignorance and prejudice it also proves nothing. Some "authorities" may have more theory than actual practice. The trouble department of any auto publication will prove that the carrying of a hot water "cooling" plant on any car, means the most grief to its owner and that complication of valves, springs, cams, etc., go to make up the balance of his trouble. This has been true when a four cylinder motor was considered a "multi" cylinder motor. What will it be with the sixes, eights and twelves! What garage has tools and men to do the work on these motors, which sooner or later must be done? How many early sixes were as good as the same make fours and why were they not? Why should not thousands of dollars, if need be, be spent in perfecting two cycle and air-cooled engines, when the actual proof of their great advantages are before us?

This should be work for the wise men from the east, the S. A. E. of Greater New York. Instead they spend valuable time deciding if the "drop" of the front spring hanger shall be so many inches, in "perfecting" the soap-box running gear now universally adopted. Early frames had a flexibility by which one wheel could run over an obstruction, or drop into a depression without twisting and wrenching the frame and the crude old "lumber wagon" can do this. So can a box car, running on rails and a good grade, but the soap-box "chassis" with its short, stiff, two-inch sweep, half elliptic springs that we imported from France, is forced on us from all but two or three makers. What driver does not know the front axle gets the worst abuse over new roads, or almost any roads? Yet we hear that "heayweight" is all that will make a car ride easy!

Why can one air-cooler maker dictate the price and all water-cooled makers be forced to sell at competition prices? Why can't we make a car for Americans and American roads that will be ahead of all others? The near "engineers" of early days are about dead, and buyers beginning to see what they ought to have, so let's banish ignorance and prejudice and let us have an ideal car, while we still may enjoy it.

Locating a Knock.

From C. E. Penrod, Ohio.—Having read in your Trouble Department the complaint made by Mr. S. H. Showalter, West Virginia, No. 1728, about his 1913 model Ford car having a knock which he cannot locate, I would suggest that it may be due to one or more loose fitting pistons, and this can be overcome by fitting in slightly oversize pistons.

Antagonism 'Twixt Riders and Walkers.

From A. G. Batchelder, American Automobile Association.—Between a man who rides and a man who walks there has been an ever-apparent antagonism since vehicles first came into use. True it is that the viewpoint of the man who walks changes rather quickly when he becomes a vehicle passenger. But it is becoming an absolute need that the pedestrian when he invades the territory apportioned to the vehicle shall be required to observe rules which make for his own safety.

People are not yet thoroughly accustomed to the increased speed of the motor-driven vehicle contrasted with that of the slower moving horse-drawn wagons. Of course, this does not mean that a small percentage of motorists do not crowd their speed to a point where it is unfair and dangerous. Admittedly they should be called to account and properly punished. At the same time there is too much of the "Oh, they don't dare to hit me" in the attitude of people who leisurely cross the streets, a part of the time in the middle of the block, or cut corners diagonally.

Throughout New York State Mr. Hugo of Albany has a task which of itself could occupy all the official hours of the Secretary of State. His evident desire to bring about sane, yet efficient, enforcement of the automobile law has been manifest from the day he took office. His purpose of eliminating the few who endanger the many deserves sincere support from the motorists who realize the growth of danger in road travel.

Many of our highways are entirely too narrow to accommodate the traffic. It is a financial question to secure sufficient money to raise our arterial roads to a standard which will meet the new conditions. Not only are passenger vehicles multiplying exceedingly fast, but the use of the commercial vehicle is extending even into exceedingly remote sections, where railroads either do not exist or are of the single-track, few-train variety.

It is now possible to reach the man "way back" with a road and a self-propelled vehicle, and in seeking the maximum of general prosperity we have come to realize that the product of the scattered individuals must be added to the sum total.

Aluminum in Great Demand.

From E. E. Alleyne, Aluminum Castings Company.—The raw material from which aluminum is made is found in as great a quantity in this country as in any other country, and the only stumbling block toward the production of this metal is the great horsepower required to transform it from its crude state into the finished material.

By the end of 1916, which will probably go down in history as the beginning of the aluminum age, the manufacturers of aluminum will be in position to take care of the great demand which now is being felt in a small way because of the wonderful practical results obtained in 1915.

The last year has seen aluminum substituted for other metals in the manufacture of automobiles to such an extent that by the end of 1916 we are planning to take care of an increased business such as has been seldom known in the history of American manufacturing.

Automobile power plants will be made up mostly of aluminum castings; through the entire automobile will be found aluminum generally substituted for other metals. Fortunately America's wealth in this metal is equal to that in the other metals used in the manufacturing world, and while the war has put the supply far behind the demand, because of the cutting off of the European product, it will be only a few months until the production has been increased to a point where the automobile business world will have little to worry about.

Demountable and Clincher Rims.

From E. E. Larson, Iowa.—It may not be generally known that wheels with demountable rims are heavier than those having clincher rims and if placed on cars originally having clincher rims may materially shorten the life of the car if not produce serious breakage.

In operation the rear wheels are at times being pushed by the engine and at times are pushing the engine, likewise the front wheels are being pushed by the car and at times are pulling the car. Thus when the brakes are applied it is often the energy stored in the rims of the front wheels more than in the car that prevents it from stopping instantly. Suppose the car has been supplied with wheels heavier than those intended for it and the engine is overhauled and the bearings made so tight that the car has to be towed around a block several times in order to start it, which happens too frequently, then if this car has a brake on the transmission which many have, and if it is driven at a high speed and the brake applied, the throttle closed without disengaging the clutch, something is likely to snap between the engine and the wheels. Most cars will stand such treatment a long time if supplied with the original wheels. One need not be a sophist if he predicts that the demountable rims in the future will be replaced with clincher rims made lighter than formerly but corrugated to give strength. No doubt aluminum will be used both in the rims and the tires.

How to Climb a Hill When Gas Is Low.

From G. B. Freer, New York.—The writer had a 1913 Ford on a hill that was so steep that he could not get the gas in the carburetor, while he had over three gallons of gas in the tank. The road was too narrow to turn around in and nearly three miles to the bottom to back down. Stalled? I guess not! I simply took a match, sharpened it to a point, wet it in my mouth on the sharpened end, and fitted it tightly in the vent hole on top of the tank. I made a paper washer for the filling plug in the tank and screwed the plug in tightly. Then I took the tire pump and fastened it over the drain cock in the bottom of the gas tank and started to pump and at the same time opened the drain cock and forced a small air pressure on the tank. The way we went up the hill was fine and dandy. This was all possible because we had what is known as an "Acorn" connection on the pump, but a rubber washer might possibly be used to the same advantage with an ordinary connection on the pump.

The More Cars the Less Flies.

C. B. Georgen in the New York Globe.—In today's Globe is an editorial in which the swatting of the winter fly is advocated. Attention is also directed in the same editorial to the fact that "The

Digitized by Google

house fly was not so much in evidence last summer as during the previous year because of an increasing public interest in his extermination."

While this attitude of the public has no doubt helped in exterminating the fly, it is just as well to bear in mind that the really potent factor has been the advent of the automobile. For the automobile in doing away with the horse has eliminated the breeding place of 95 per cent. of the flies, which is the percentage, according to the current number of the Scientific American, bred in horse manure.

Thus the automobile has been a most important factor in the elimination of typhoid fever and many other microbic diseases, in addition to the improvement in roads, farming conditions, etc.

All Want Lower Priced Cars.

"It is intensely interesting to compare the questions of motor enthusiasts who are attending the show this season with the questions asked by visitors of former years," says John N. Willys, president of the Willys-Overland Company of Toledo.

"Big, heavy cars costing up in the thousands of dollars were all that would formerly interest people, even of moderate means, and as for those who could afford a high-priced car, they would no more think of driving anything else than walking. But at present, economy in weight, fuel consumption and upkeep expense are the important questions people want answered in detail. They have learned that the initial cost of an automobile, while an important consideration, is not the determining factor in choosing a car. The expense of keeping the car in operation is the thing which every automobile buyer knows will determine the saneness of his investment from a business standpoint.

"In other words, the public realizes more than ever before that a light weight, medium priced car, produced on a large production scale and backed by a reputable concern, is the most sensible automobile investment that can be made."

A Choked Gasoline Pipe.

Recently an involuntary engine stop occurred on the road, and it was found that the pipe between the tank and the gasoline filter was choked up, and a lot of trouble was experienced in removing the obstruction. Chips of paint from the gasoline tins had found their way into the pipe, and had completely blocked it up. To dislodge this the tire pump had to be fitted on to the gasoline pipe, and this was found to be a somewhat difficult matter. Since then an attachment to the tire pump tube which will couple direct on to the gasoline pipe has been carried, so that in future there could be no difficulty in blowing through the gasoline pipe, or for that matter an oil pipe if necessary.

The moral is, of course, that a filter should always be used when filling the tank, irrespective of the efficiency of the filter in the gasoline pipe.

Perfection Grease Retainers.

A good many of our subscribers want to know who makes the Perfection Grease Retainers for Ford cars, alluded to by our correspondent in California, on Page 53 of the November number. Any reader who can furnish the information will please address the editor of the Automobile Dealer and Repairer, New York.

SOMETHING ABOUT OILS.

How to Get the Best Results in Running and Little Carbon.

When the internal-combustion engine, such as is now used in motor cars, motorcycles, boats, etc., first came into use in this country, it was thought that practically any kind of very heavy petroleum oil would be satisfactory for its lubrication; but it was soon found that the dark-colored and black oils contained too much "free" carbon, which was the cause of many of the earlier difficulties with this type of motor. In fact, carbonization was so prevalent a trouble in the early days of self-propelled vehicles that the announcement of an oil manufacturer that he would guarantee his oils not to carbonize an engine within 200 miles of running caused much astonishment, and was not generally believed by either the trade or the consumer.

A heavy-bodied oil was necessary for use in the old-fashioned engines, as their pistons and bearings were not accurately fitted, and the greater "body," or viscosity, had a tendency to fill up the uneven surfaces and fittings and to increase and hold the compression. Later on, when motor car engines were more highly refined in their adjustments, it was found that the lighter-bodied oils could be used with greater satisfaction, particularly because they contained less "free" carbon.

A great deal has been written and said about oils during the past few years, both from a technical and advertising standpoint, but of all the foolish and misleading statements the one that certain oils "contain absolutely no carbon" is certainly about as far wrong as it is possible for a statement to be, for all petroleum lubricating and burning oils are made up of varying percentages of hydrogen and carbon, and are, in fact, chemically known as "hydro-carbons." Therefore, the elimination of the carbon would mean the breaking up of the oil into some other chemical element.

Practically in every case where one experiences carbon trouble the blame is attributed to the oil used, little thought being given to the fact that carbon deposits are oftener than not caused by a number of other conditions which may prevail in an internal-combustion engine. About ten years ago, when gasoline was plentiful—in fact, at that time it was really hard to dispose of the quantity necessarily made with the other petroleum products—refiners ran their crudes as far as it was possible to other products than gasoline. Consequently, the gasoline manufactured at that time was of a very light gravity, meaning very light in weight compared with an equal bulk of water, and it was of a highly volatile nature. Quite naturally this gasoline would more readliy combine with the oxygen of the air than would a heavier product, on account of its gaseous nature, and when the mixture of this gasoline vapor and oxygen was burned or exploded in the explosion chamber of the cylinder, the combustion was very rapid and complete, and a minimum residue was left to cause carbon deposits.

But with the increase in the number of gas engines during the last few years, and the consequent large demand for gasoline, the petroleum refiners found their position exactly reversed; gasoline was and is really scarce, and something had to be done to meet the demand. The only thing the refiners

Digitized by Google

could do was to increase the percentage of yield of gasoline from a given amount of crude oil. This meant the producing of a heavier-gravity product that was not nearly so volatile in its nature, and, in some instances, we now find gasoline, or what might more properly be called "motor fuel," which is of but slightly lighter gravity than ordinary gasoline.

Anyone can make a simple experiment and burn a small amount of gasoline and kerosene in partially-covered cups; the first will flash off rapidly and leave practically no soot, the other will burn more slowly and leave quite considerable soot or carbon. While the improved carburetors manufactured to-day will perform their functions satisfactorily with the heavier-gravity gasoline, it should be remembered that, when it is used, there is not always such efficient combustion as there should be, and, if the combustion is incomplete, there is a residue of carbon which, under the heat of the explosion, will bake on the interior of the cylinder, piston heads, valves and valve seats.

When the percentage of gasoline in the mixture is too high, that is, when the mixture is "too rich," carbon deposits will form rapidly. A mixture of this kind is indicated by a black smoke from the exhaust or by a strong odor of burnt gasoline from the same place; also, if the percentage of gasoline is too great the motor will run sluggishly at low speeds and the explosions will be muffled.

No matter how good an oil is used, too much of it will cause carbon deposits on account of the inability of the heat of the explosion to burn off the surplus; this condition is readily shown by a blue or grey smoke from the exhaust pipe.

Another thing of which very little has been written or said is that a careful chemical analysis of scrapings from the interior of cylinders of motor car engines very often reveals that they are largely composed of silicate. Now, as silicate is an element entirely foreign to either oil or gasoline and to the motor itself, we must look around and see how it gets into the motor and how it is formed. Silicate is but another name for dust or sand, and when the road dust is drawn through the carburetor with the mixture into the cylinders, it is there retained by the partially-burned oil, and the great heat of the explosions bakes it on to the cylinder walls, causing hard, brittle deposits. In view of this condition, it might be well to suggest to manufacturers of carburetors and to designers of motors that they modify or change their designs so as to prevent, as far as possible, this dust from being drawn into the interior of the engine. If they succeed in doing this they will have removed one of the causes of deposits in the cylinders and also another cause of trouble, for if the dust gets into the crankcase it certainly helps to wear out the bearings located there.

There is still another reason why deposits of carbon collect. After a gasoline engine has been run for a certain length of time, the exhaust pipe and silencer are apt to become more or less clogged with carbon, dust, dirt and partially-burned oil. This results in back pressure, and when the motor cannot exhaust freely the carbon trouble appears again, only this time it is caused by the incomplete scavenging or cleaning out of the cylinder. Another thing which makes it important to have the burnt or exploded gases carried off quickly is the necessity of having the explosion chamber clean when the suction stroke begins, for if the partially-burned gases are mixed with the fresh charge of gas from the carburetor, the entire mixture will be weakened, causing a heavy loss of power.

The motorist who desires the best results from his car and the least carbon, is advised to use as light a gravity gasoline as it is possible to secure; to be careful to see that the engine is not running on too rich a mixture, this implying incomplete combustion; that too much oil is not used; to see that the exhaust pipe and muffler are clean and that there is a free passage for the burnt gases; to keep as much of the road dust out of the carburetor and motor as possible, and, finally, to use only an oil of known merit and not some cheap, unbranded product which may be adulterated, and which may cause damage amounting to many times the value of what is saved by its purchase.

Misfiring of a Ford.

A case of intermittent misfiring on one of the latest Fords baffled even those motorists who had long experience on Ford cars. After the car had done about 500 miles, misfiring would occur occasionally, and, despite putting in a new set of plugs, carefully examining all wiring, thoroughly cleaning the commutator, and adjusting the tremblers, the trouble was not located. An accumulator was also used to test the buzz of each trembler. The trouble was finally traced to one of the coil units, which occasionally rose off its seating, and it was found that the heat had shrunken the wood of the units, causing a loose fit in the stamped iron coil box. In the older models this coil box used to be made of wood, so naturally when any shrinkage took place, the box shrunk with the units. The wedging of the units with a piece of wood partly overcame the trouble, which ceased on inserting thin pieces of glass paper between the units—of course, not on that part of the unit making contact—and also a strip of rubber on the grooved edge inside the top of the lid of the box.

Enormous Increase in Auto Exports.

Export of motor vehicles climbs to higher and higher figures. For the twelve months ended in December, 1915, the per cent. of increase over the preceding twelve months is placed at 250 per cent. The greater part of this business was in trucks, but the value of passenger automobiles is figured to be more than one-third of the total. During the continuance of the war the totals of export will probably show progressive gains, as armies are found to be more efficient the more wheels there are under them. More shipments go from New York than any other port. The average for weeks from New York has been not less than 850 cars per week. Following are chief items in export of motor vehicles:

Estimated total value motor vehicles exported during 12 months ended December, 1915	$100,000,000
Increase over previous 12 months	250%
Estimated value exports of commercial vehicles during 12 months ended December, 1915	$63,000,000
Increase over previous 12 months	623%
Estimated value exports passenger cars during 12 months ended December, 1915	$37,000,000
Increase over previous 12 months	90%

Automobile Dealer and Repairer

A Magazine of condensed and compact information for busy readers.

Member of the Audit Bureau of Circulations.

PUBLISHED THE MIDDLE OF EACH MONTH BY

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York

Telephone, {7377 / 7378} Barclay — Post Office Box 654

Entered as second-class matter at the Post Office in New York City.

M. T. RICHARDSON, President and Treasurer — F. R. WHITTEN, Secretary

A. A. HILL, Editor

F. R. WHITTEN, Advertising Manager

E. DAYTON, New England States

H. F. LUDINGTON, Illinois, Indiana, Michigan Wisconsin and the West

F. M. DAMPMAN, New York, New Jersey, Pennsylvania, Ohio

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK, JANUARY, 1916.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

THE FUTURE VEHICLE.

Unless nature has still another secret which she can be prevailed upon to give up, no one need look for any fuel for automobiles that is better than gasoline at the present price or at anywhere near the present price.

Although, of course, there are other considerations than heating value for such fuel, there is nothing known in quantity that gives as much heating value as gasoline. A pound of alcohol gives up abaut 11,800 British thermal units and a pound of gasoline about 18,000 such units.

Although the gasoline car is at present far ahead of the electrically propelled car, the last named will undoubtedly be the car of the future. And it will be so long before that period arrives which scientists term "the electrification of everything." Electricity is the one thing in the world that is practically inexhaustible. A writer in the World's Work recently stated that steam generated power—boiler and engine in each industrial plant—is giving way to power from electrical-generating central stations, which supply current for many power users. He says:

"Take the map of the United States and see how the network of great distribution systems is already growing over it. In the South, five States—North Carolina, South Carolina, Georgia, Alabama and Tennessee—have a thick overgrowth of high-power transmission lines, the cables of eight systems with physical inter-connection, so that energy from a score of hydro-electric plants, helped out by some steam-turbine stations, flows through the combined system to the section that needs the energy most. The Southern Power Company, with 1,300 miles of transmission lines, is already furnishing the drive for 150 cotton mills. At the western end of this southern interconnected zone two new developments now approaching completion will soon be joined, it is said, and then the copper of a great arterial system will be continuous from the Atlantic to the Mississippi."

According to the Department of the Interior, the available water power of the United States amounts to about two hundred million horsepower, or probably about three times as much as all the animal and steam power combined. But this does not take into consideration the tides of the ocean which are simply exhaustless.

The tides of the sea will be employed before long to generate electric current. They would have been employed for this purpose long before if the same study and talent had been brought to bear upon the subject that has been bestowed upon a search for some substitute for gasoline.

But cheap electric power is of course not all that is required to bring the electric vehicle into universal use. The vehicle itself must be reconstructed to meet its peculiar requirements of being obliged to bear the tremendous weight of the battery. There is no reason why the frame of the battery should not also be the frame of the car, the shape of the cells being changed as required. In other words, the battery should be made to bear rather than be borne.

As at present designed and constructed, the electric car has decided disadvantages, but the chances for improvement are far greater than in the case of the gasoline car.

MAKE IT THE YEAR ROUND.

The automobile business is rapidly approaching an all-the-year-round state. Accessory and car dealers should do all in their power to help the movement along. It has been demonstrated again and again that an automobile can be used in snow and in cold weather more economically and with greater success and comfort than a horse-drawn wheeled vehicle. Quite likely people do not use their cars so much for pleasure in winter as in summer; neither do they use their horses as much. Wherever and whenever there is economy in using automobiles over horses for business or trucking in summer, there is the same economy in their use in winter.

Accessory dealers and automobile agents who stand idle in winter, making no effort to get business, make a big mistake. If there is more leisure on the part of purchasers in winter, then they have all the more time to consider their real needs. And if their cars are more liable to be idle, then there is a better chance to install needed replacements and for overhauling.

A spasmodic business is not a good business. Anything that is out of equilibrium—out of balance—is out of health. There is no reason whatever why the automobile business should not be continuous the year round. It needs nothing but a little effort on the part of accessory and car dealers to create a healthy balance so that it will not be "a feast or a famine," a rest or a rush. A little more effort to get business in winter would benefit both repairmen and dealers as well as car owners themselves.

TRAVEL COMPETITION.

Some of our older readers may recall that it was stated in this magazine some four or five years ago that the railroads would soon find the automobile their most formidable competitor. This is now not only demonstrated, but the automobile may soon so overcome transportation monopoly on the part of the railroads that the problem of rates so long considered by the Interstate Commission, may be settled in the natural way, namely, by competition.

A score of instances might be cited where the automobile is now successfully competing with the railroad, and indeed, carrying passengers at a rate not yet being met by the railroads. For instance the distance from Santa Barbara to Los Angeles, Cal., is 105 miles, and the fare by automobile is $2.50. By rail the fare is 3 cents a mile, or $3.15. From Los Angeles to San Diego, Cal., the distance is 125 miles, and the automobile fare is $2.50, while the railroad fare is $3.75.

What is the lesson to be drawn? Why, either modern railway travel is not the most economical and efficient method, or the claim made that the United States government has enforced too low rates is not well founded.

Surely, if a system of travel that has had 75 years for development is unable to compete with one of but 8 or 10 years' development, it is easy to imagine the final outcome. It is true that in the instances cited, and quite likely in most others where the automobile is now carrying passengers at a less rate than the railroads, there are probably special favorable automobile conditions, but with additional highway expense somewhere near the cost of private railroad beds, grading and tracks, the final outcome is to say the least, somewhat uncertain.

LIQUOR AND CAR DRIVING.

It has been a rule of law that no cognizance can be taken as to whether a man accused of crime was drunk or sober, although juries sometimes seem to feel that drunkenness should be used as a palliative to punishment. But the law says he must be punished for the crime alone and the condition he was in when he committed it has nothing to do with the case.

But a well-intentioned member of the Massachusetts legislature thinks differently. He has filed a bill which provides that drunken drivers shall have their licenses suspended for a first offense and permanently revoked for a second. Drivers, drunk or sober, who hit a person and run away are even more severely penalized. They are to be liable to a fine of $100 to $1,000 or imprisonment for three months to three years or both.

Purely as a matter of fact or logic, it is no crime to drive a car whether a man be drunk or sober; the crime is in driving so carelessly that some one or thing is injured. Under ordinary circumstances, the rule may be well held to that the condition, either mental or physical or both, a man is in when he commits a crime should not affect the punishment. But if any exception be made, it may well apply to driving a car, and for two reasons: First, the exhilaration of the natural sort in driving is sufficient to create a tendency to recklessness, as the volume of accidents prove, and any addition to such recklessness inspired by the use of a few drinks is a menace to safety that should not be tolerated. No one knows how many accidents are due purely to whiskey stimulation when the mental or nervous activity is not apparent. And second, anything rational that may be done to increase temperance, or total abstinence, for that matter, is a valid subject for legislation.

LESSONS FOR DRIVERS.

Carelessness and Ignorance Responsible for Most Accidents.

Is Killed Fleeing Accident Scene.—After running down and seriously injuring a woman, and then endeavoring to make his escape, a man was killed and his companions injured when their automobile overturned against a tree in rounding a corner. The accident occurred at Los Angeles, Calif.

Steering Device Broke.—A young man was injured so that his life is despaired of, in an accident at Gardner, Mont. The young man was driving and while at a high point where there was almost a sheer drop on one side and high walls on the other, the steering apparatus broke and the car hurled forward and went over the precipice, down a distance of over fifty feet.

Loses Control of Car.—A young man lost control of his car while coming down a hill at Madison, Wis., and ran it onto the sidewalk, striking a man wheeling his child in a baby carriage. The child was thrown out, the wheels of the car passing over its body, crushing it to death. The man was severely hurt.

Driving Without Lights.—Four men were riding in a car near Monroe, Wis., without the lights turned on. The driver failed to see the road and the car swerved as they approached a bridge. It struck the bridge and went over an embankment. One man received a concussion of the brain and the others were more or less injured.

Touched the Self-Starter.—A young woman was killed near Beachy Head, Ky., when it is supposed she touched the self-starter, which was the only thing, her husband states, she knew how to use about the car, and the machine started and went over a cliff. The woman's husband had just left the car and turned to look back but the automobile had disappeared as stated.

Irresponsible Because of Drink.—A young woman was knocked down and killed at Mt. Carmel, Ill., by a driver who stated that he had been drinking and did not know what he was doing. The woman's skull was fractured.

Carries Candle Into a Garage.—A man was leaning over his car with a lighted candle preparatory to starting the engine, at Topeka, Kans., when the flame of the candle ignited gas escaping through a leak. Flames covered the tank in an instant and threatened to burn up the car. Firemen were called and extinguished the fire before the car was badly damaged, but the man's hands were severely burned and he was obliged to receive medical treatment.

Struck by Passenger Train.—A young man met instant death in his new car near Hastings, Neb., and a young woman will probably die as a result of injuries received and exposure, due to a collision with a passenger train. When the young woman was found, after a night of helpless agony, both her legs were broken, and the body of her companion was found nearby face downward beneath eight inches of mud and water.

Digitized by Google

Smothered Under the Car.—Near Gary, Ind., a woman and two men were found imprisoned beneath an automobile which capsized in an isolated marsh. A man who was walking along the road saw a red light gleaming in the darkness and wading over to it saw a woman's foot protruding through the mud and water underneath the wreck. After an investigation it was learned that the car must have been driven at an excessively high rate of speed.

In a Blinding Snow Storm.—Two women and a man were killed when the driver, blinded by a snow storm, got off the road near Sterling, Ill., and plunged off a culvert into a creek which was swollen with four feet of water. A young woman and man were drowned and the other woman was caught in the wreckage and so badly crushed that she died inside of an hour.

Red Lantern Went Out.—An automobile went into a sewer excavation at Battle Creek, Mich., and the driver was painfully injured, because a red lantern stationed where a sewer was being excavated went out.

String of Idle Cars Obscures Track.—Two women were killed at a railroad crossing at Barry, Ill., when a collision occurred between the automobile in which they were riding and a freight train. There was no flagman at the crossing and the driver was going slow. As he passed the idle string of cars he noticed a box car coming toward him. He kept going and the car kept approaching with the above result.

Used Lantern to See If the Tank Was Full.—At Morris, Minn., a man placed a lantern on the seat of his car so that he could see when the tank was full of gasoline as he poured. The moment the gasoline left the can a ring of fire appeared on the rim of the tank. Quick action was taken. the fire department called and the man escaped without injury. The car was damaged.

Automobile Stops on Railroad Track.—Four people were instantly killed in a railroad crossing accident at Chicago, Ill., when the driver in attempting to avoid the collision became bothered with the brakes and the machine stopped dead on the track.

Broken Beer Bottles Cause Accident.—A pile of broken beer bottles in the road near Shenandoah, Ia., which it is stated were placed at intervals along the road by persons prejudiced against motorists, caused two tires on an automobile to explode. The car was thrown to the side of the road and upset, severely injuring both of the occupants.

Car Skidded.—A man was drowned and his companion severely injured when the car in which they were riding skidded off the boulevard extension and fell into a lake near East Hammond, Ill.

Intoxicated Man Insists on Driving.—One man was killed and two were hurt near Amboy, Ill., when the owner of the car insisted upon taking the wheel when he was in an intoxicated condition. He drove the car up an embankment and in trying to bring it back it turned turtle. One man's temple was gashed, his skull cracked, windpipe broken and he also received internal injuries. He died on the way to the hospital. The driver's head was badly gashed, and the other occupant suffered internal injuries.

Head Bent in Snow Flurry.—A woman, with arms filled with bundles from Christmas shopping, and head bent down in the face of the snow flurry, was struck and killed by an automobile at Chicago, Ill.

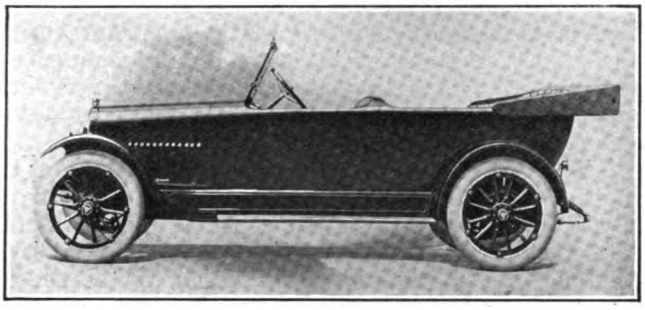
THE HUDSON SUPER-SIX.

Claims That it is a Revolution in the Motor Car World.

There is presented what is called a marvel motor in the new Hudson Super-Six. The name Super-Six is to be the designation of the new car and this name is registered and is the sole property of the Hudson Motor Car Company. This is not a mere new model with minor refinements, but it is an absolute upheaval of all present impressions regarding motors, and particularly regarding six cylinder motors. The inventors and builders claim that the Super-Six begins a revolution and their belief may be realized.

The heart of the new Hudson Super-Six lies in the motor. Its power has been increased by 80 per cent. It has reached 76 horsepower without added size or cylinders. It is a complete and radical revision of the six cylinder motor familiar to engineers and to car owners. The principle is new. In every atom of efficiency it establishes higher standards. The big fact back of the new motor is that with cylinders only 3½ inch bore by 5 inch stroke, exactly the same size as last year's light six, the new motor develops 76 horsepower maximum whereas last year's motor developed but 42 horsepower. Even this motor quadrupled Hudson production and to a large extent revolutionized the building of motor cars of the light six class.

H. E. Coffin, Vice-President and Consulting Engineer of Hudson Motor Car Company, in his first car.



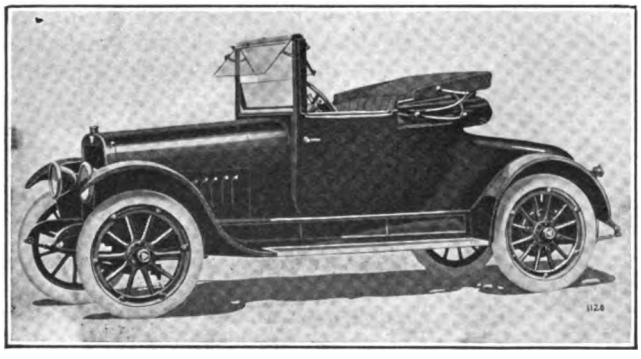
Constantly, however, the Hudson engineers were looking for something still better. In pursuit of their ideas, they built several V type motors, both in eights and twelves. They also bought every V-type motor of prominence on the market. But the advances apparently gained by some of these motors did not seem to the Hudson engineers to be sufficient. They invariably meant more weight, more cylinders, more complications, and this without sufficient compensating gain.

The Hudson engineers thought they saw the way to a far better solution and that is the reason the Hudson never adopted either the eight or the twelve. At last the problem was solved, and on June 28, 1915, the Hudson Motor Car Company applied for a basic patent on their engineering discovery. This patent was granted on December 28, 1915. This new motor is strictly conventional in every feature. It

Digitized by Google

is simply an advance on the present type of standard motor. The patent is granted on a principle rather than on any one mechanical part, although there are certain details of construction that are in themselves revolutionary.

The best six type reached its practical limit at moderate motor speed. There was a point at which vibration became severe and the absorption of power heavy. The average six of about 288 cubic inch

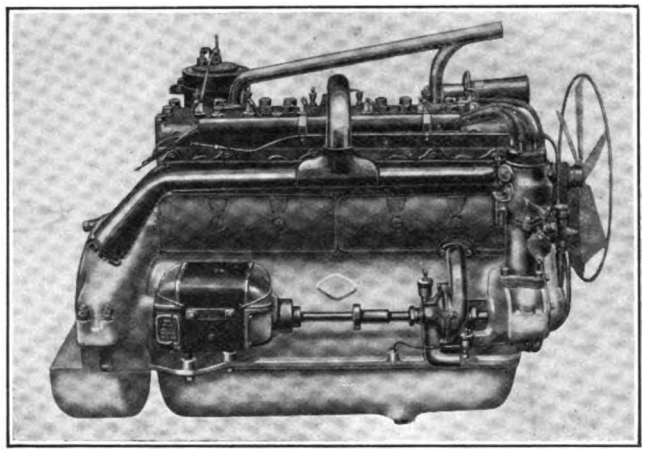


Super-Six Phaeton, Seven Passenger

cylinder capacity developed at maximum speed about 42 horsepower. The rest was lost through what the engineer calls friction. This meant fuel waste and waste of power and it placed a limit on speed and flexibility. The new Hudson Super-Six so nearly eliminates vibration and loss of power due to internal friction and lack of balance that the motor is capable of enormously high speed. Its ability exceeds by half the best performance the old type sixes.

The new Hudson motor persistently maintains efficient working conditions at speeds very far in advance of anything before known. It has been driven for hours on the test block at these high speeds developing constantly and smoothly over 70 horsepower. At the end of a severe test of this description neither motor nor bearings showed the slightest discoverable wear.

The Super-Six in official tests on the Sheepshead Bay track under the rules and supervision of the American Automobile Association has broken all stock car records up to one hundred miles. This



Super-Six Cabriolet, Three Passenger.
(Top Down)

with a car exactly the same as will be delivered to buyers of the 1916 Super-Six.

No change was made in compression, in pistons, in valves, camshaft timing or any other respect. The car was a stock car in all details. The chairman of the Committee on Tests of the American Automobile Association visited the Hudson factory and spent an entire day in personally measuring the car that was driven on the track and also other cars. This for the purpose of satisfying himself that there was nothing whatever special, or unusual about the motor that was to be used in the test under his supervision. After this inspection and measurement he certified that the car that was used on the Shepshead Bay track was a stock Hudson in every detail. Very many tests of various kinds were made at Sheepshead Bay. With two passengers in the car and with windshield and top in place the Super-Six made a record of 100 miles in 80 minutes 21.4 seconds, or an average speed of 74.668 miles per hour. One a two-mile lap, one complete circuit at the track, its record was 76 miles per hour. This was done not once but several times. Many times in succession it made records of a lap in one minute 33.4 seconds to one minute 33.8 seconds, varying only by the fraction of the second. Its clock-like regularity was amazing to observers. With five passengers in the car, and with the windshield and top up, it has exceeded 73 miles per hour, and averaged slightly over 70 miles in sixty minutes running.

The fuel consumption at 60 miles per hour is about the same as like sized motors at 40 miles per

Super-Six Motor (Right Side)

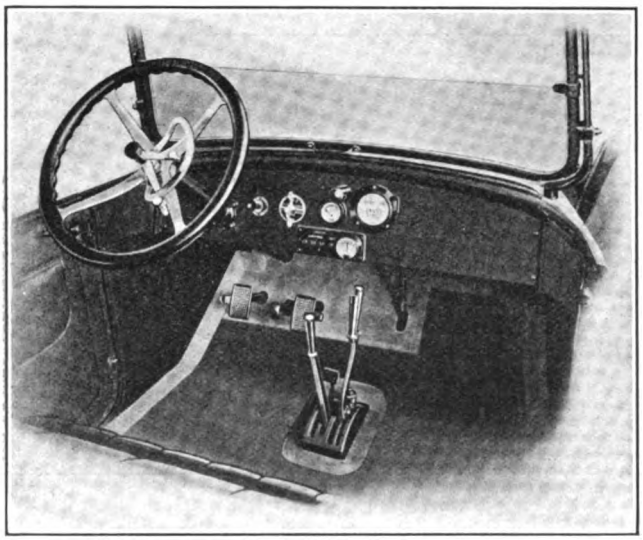
hour. And the motor runs as smoothly at low speeds as it does at high speeds, which means that the life of the motor is increased, due to its smoothness or lack of vibration. All these things come, so say the Hudson engineering department, from reducing vibration to a point never before attained in any type of motor. The Hudson has built all types including eights and twelves for comparison, and the tests for results all overwhelmingly favor the Super-Six.

The object of high speed in a motor is not merely high speed in the car. It can be utilized for speed if the driver wishes. But the fact that the motor is capable of this speed insures power, flexibility, ease of control, quick acceleration and reserve capacity for difficult roads or hills.

It gives the ability to creep at low speed on high gear. The Hudson Super-Six can be driven at a walking pace on high gear. It gives the ability to accelerate quickly to climb hills on high gear and to avoid changing gears on rough roads, or in crowded traffic. The Super-Six is permanently an exclusive Hudson feature. It is protected by basic patents granted on December 28, 1915.

In beauty, luxury and finish the Hudson Company announces that it has done its best to reach the apex

Digitized by Google



in the Hudson Super-Six. No question of cost was considered. A car was wanted which looked the supremacy the new motor gave it.

Hudson bodies have for years been famous. In the 1916 car was brought out the yacht-line body which has been the model for many other cars, both in the style of the body and in the name of the car. In the Hudson closed cars last fall many new standards were set in design and appointment. They were conceded by well-posted buyers to be the most artistic models shown.

The Hudson Super-Six, both in open and closed models, is a masterpiece of beauty, not in big things alone but in little—in the hundreds of details which appeal to the critical. Buyers will find every item on the car is in keeping with the motor.

The new car has new body lines, the radiator is higher, the body is lower. The windshield is set at an angle. The vertical windshield centers the draft and the dust on the back of the driver's head. The Hudson slanted windshield carries it over the car and offers less resistance.

The seven-passenger phaeton has a still more roomy body. The two extra tonneau seats disappear when not wanted. The body is built with a double cowl.

Super-Six Driver's Section and Controls.

The upholstery is all of fine grain, genuine leather. Not only the seats but all the leather parts consist of this extra grade of leather. No fabric leather is anywhere employed. The upholstery has been deepened, the seat curves have been remodeled to perfection. The tonneau of the car is finished with a handsome carpet which is carried up over a portion of the back of the front seat and above that the finish is a paneled leather design of extreme richness and beauty.

Mechanically the new car offers some further distinct improvements. The Hudson engineering department has designed its own carburetor, an entirely new design of the pneumatic type, showing great efficiency. It automatically insures the exactly right mixture of gasoline and air at any speed. One may step upon the accelerator pedal, depressing it to the full extent and there will not be the slightest indication of choking or strangling in the engine. It picks up the load instantly and smoothly. This feature alone to those who have ridden in the car has been a never-ending cause of exclamations of wonder. At high speed the motor cannot be starved, at low speeds it cannot flood. At all times there is perfect combustion, resulting in the minimum use of fuel.

The supply of oil is regulated automatically by the speed. As the speed of the motor increases, the flow of oil also increases to meet it. When the motor speed decreases, the supply of oil automatically is restricted in proportion. The cylinders are fitted with a removable head. A new ignition system is employed. An automatic governor controls the spark advance. The water pump connects directly with the cylinders without any intervening pipe, thus the water line can never leak, nor develop defective joints.

The gasoline is carried in a twenty gallon tank in the rear, and is supplied to the motor through a vacuum system designed especially for the Hudson Super-Six. This is further supplemented by an auxiliary hand vacuum pump which makes the system positive in any emergency. Hudson models on the new Super-Six chassis will be as follows, the prices being attached:

Touring car or phaeton, 7-passenger	$1,375
Roadster, 3-passenger	1,375
Cabriolet, 3-passenger	1,675
Touring Sedan, 7-passenger	1,900
Limousine, 7-passenger	2,500
Town car, 7-passenger	2,500

All these prices f. o. b. Detroit.

KEEPING CHARGE ACCOUNTS.

With Time Slip and Repair and Supply Cards for Simple Accounting.

Many competent automobile mechanics, who are proficient in the work, have made a failure in the repair business because no record was kept of the profits and losses, leakages, supplies and time charges. The majority of the failures assumed that because they charged 60 cents an hour for their labor that it meant $6 a day or $36 a week in the cash drawer, but such a basis of reckoning is false. The overhead expense and unprofitable time were not considered.

The repair man who expects to find the balance on the right side of the ledger at the end of any given time, such as six months or a year, must not set too low a price on his labor. If he has been repairing springs, etc., he should not take the labor charges as a basis upon which to figure general repairing, particularly if the charge per hour has been less than 60 cents. There are some repair men who will not agree with the writer, maintaining that there is good profit at 50 cents an hour, but a careful analysis of the costs of operating and maintaining a repair shop for motor vehicle repairing shows that none too much profit can be made when charging 60 cents an hour. It is admitted that the overhead expense will be more or less, according to locality, but this factor is generally overlooked, especially if a part of the shop be set off for the automobile department.

Let us assume that Mr. B. Smith conducts a garage or machine shop and finds that there is a call for automobile repairing; in fact, some of his customers have had minor auto repairs done and offer to send their motor car work if Smith will

Digitized by Google

open a shop. Smith thinks it over and decides he will go into the business as a side line. As Smith is not proficient in automobile repair, he decides to hire a repairman at, say, $18 a week. Smith figures that by charging 50 cents an hour and work-

ing his man 60 hours a week that he will make $12 a week on his investment, or about $600 a year, a profit that looks good to Smith. But if Smith is a business man he will take his pencil and do some figuring before he decides upon his labor charges. After careful figuring he will find that 50 cents an hour is not enough, for the following reasons:

Smith has not made any charge for depreciation. Some large garages figure 25 per cent. as legitimate for the wear and tear on tools, machinery, etc., and for replacements. This figure would be too high for a small shop like Smith's, but it is reasonable to assume that some of the tools will be broken, therefore, a small per cent. should be charged to depreciation.

In fact, Smith must keep his workman busy 40 hours each week in order to break even. Now, it is not always possible to charge up $36 a week in labor, for a number of reasons, the principal one of which is termed unprofitable or unproductible labor. For example: A customer comes in with his car and wants to know about fitting a new carburetor he is thinking of installing. The repairman must look over the motor to ascertain if the carburetor can be installed and what will be necessary in the way of connections, etc. Invariably the owner will ask endless questions about the carburetor or another make, and when he leaves the workman has lost about 30 minutes.

Another customer drives up and asks for the workman, stating his mixture is not right, although the workman overhauled and set the carburetor a few days previous. The workman has to take a few minutes to explain why the motor does not pick up as fast with the throttle set at a certain point as it did before the change was made. An hour later another customer may take 30 minutes by asking the repairman to figure out how a motor starter and lighting equipment can be fitted to the car. And thus it goes—time that cannot be charged except to unproductive labor. If the customer decides upon the work and the repair shop purchases the equipment, the 25 or more per cent. profit made in the sale more than balances the lost time. This brings up another factor to be considered, and that is having on hand complete information of any equipment which an owner may be interested in. And the repairman should be a good salesman if he is to be valuable to the house. A practice indulged in by one shop is to allow the workman a small commission on equipment sold which makes him hustle for the business.

Under the head of unprofitable labor can be included time lost answering telephone calls, checking up the tools and equipment of the car entering and leaving the repair shop, and running to the supply house for material, etc., apparently unimportant items, but taking considerable time in the course of a month. Another factor, one generally overlooked in small repair shops, is proper charging of small material, such as cotter pins, lock washers, etc. True, these are not expensive when purchased in quantity, but there is no reason why a reasonable charge should not be made of the material. It is legitimate to charge for such material.

To overcome these leaks, as well as others that are inherent with automobile repairing, Mr. Smith should have his workman make a list of material used, both the chargeable and non-chargeable, and establish a scale of prices. With the costs of the material at hand, it should not be a difficult matter to arrive at a charge which will prevent loss as

well as not work a hardship on the owner. The practice of making up the losses by padding the time slips is not to be recommended. Give the customer a square deal at all times if you would retain his business. He will not object to paying for

Digitized by Google

material used, but will object to time not utilized on his car.

The system employed for charging up the labor on a car is most important, as it affects both the shop and the owner. The time charged for performing a certain piece of work is often questioned by a certain class of owners, particularly the automobilist, who does not take into consideration that it may take two hours to get at a part that requires but fifteen minutes to adjust. Because of this and other reasons, the shop should employ some accurate method of keeping track of the time, a system that will not leave the customer a leg to stand on should he dispute his bill. A time check system may seem unnecessary, but the writer can quote several instances where such a system ended a dispute and doubtless saved the cost of court fees.

REPORT O.K.

DELIVERED TO
SIGN OWNER H. C. Brown

Fig. 3—Form of card to be attached to work describing repairs to be made, date job is promised, etc. Card provides for checking equipment, etc. A similar form can be purchased ready made.

One particular instance will demonstrate the point involved:

The owner, in passing the repair shop on his way to his office, noticed a workman leaving the machine to go to work on a car that had been driven up. Out of curiosity the owner watched for several minutes, then went on his way. Later in the afternoon he again passed the shop and noted that the workman was still busy on the other car. Making a note of it, the owner determined to ascertain how much time was charged up to him on that day. On receiving the bill, he kicked long and hard, said that no such time could be put in, and finally, to cap his argument, told what he saw on the day in dispute.

Now, if the repair shop had not been equipped with a time checking system, the chances are that an adjustment would have been necessary to appease the customer. But after hearing the owner's side, the proprietor of the shop asked the bookkeeper for the time slips for the workman of that day. These included the slip for the owner's car and that of the other machine. Each slip bore the time the workman started and finished in hours and minutes on each job, and the figures stamped by the time clock also showed that it was only possible to charge up the maximum time of the workman on the both jobs; that is, there was only 10 hours labor in all. It should be explained that the workman was obliged to stamp the time he started on a job, and should he be called off to work on another job, he stamped the finish time on the card of the first job, then stamped the starting time of the second job on a separate card. It is obvious that the complaining owner could not dispute the time. He was convinced.

A time clock is not essential in a small shop, but it is necessary to utilize some accurate method of keeping track of the work, for the benefit of both the owner and the proprietor of the shop. The slip shown at Fig. 1 can be utilized to advantage and is practical. It consists of a manilla card with string, about four to six inches, or any similar standard size. The cost of printing is slight. One side is employed for setting down the starting and finishing of any work, also the date. The reverse side is employed for charging up the parts, material, supplies, machine work, etc., as shown at Fig. 2, and when the work is completed a record is afforded. The slip is filed away and is readily obtainable should an owner dispute any labor. The slip also affords the owner of the shop an opportunity to estimate profits and losses in that he can figure how much unprofitable time is consumed by his workman.

Any shop, small or large, should have a job tag similar to that shown at Fig. 3. When a car comes into the shop the name and address of the owner is entered, as is the license number, motor number and that of the job. Space is given to the date of arrival and when the work is promised. There is also room for entering the description of the work ordered, also a list of equipment. The equipment of the machine should be checked up on its arrival and its departure, so that the owner cannot claim that he had two extra shoes instead of one. This checking system is especially valuable when the job includes a complete overhaul, which necessitates stripping of the chassis, etc. If the car is to go to the paint shop, it will be necessary to check up tops, curtains, lamps, horns, etc., all of which are listed in the slip referred to. This checking should be very carefully performed, and when completed the tag is tied to the steering wheel.

As may be noted, the tag provides for the remarks of the workman testing out the chassis, also space for the signature of the owner or person authorized to receipt for the car when finished. This may appear to involve unnecessary work, but it protects the owner of the shop and is a record that will hold in court. Some repair shops incorporate a clause to the effect that the owner signing the slip is satisfied with the work. This is done after the owner has tried out the car in company with the workman. This prevents that class of owners who delay paying bills from using the old time excuse of "the work was not done properly."

Referring to Mr. Smith once more. He has decided, after taking into consideration the opportunities for losses and leaks as above described, that a charge of 50 cents the hour for labor will compen-

Digitized by Google

sate him for the investment. On the other hand, another shop may find that the overhead charges warrant a higher rate. As previously explained, the locality and existing conditions are factors in determining the charge, and these, with the overhead expense, will enable the repairman to arrive at a decision. Automobile repairing, if conducted on a business basis, is profitable. On the other hand, slip-shod methods spell failure.

SOME LEGAL CASES.

Things Car Owners and Drivers Should Carefully Read and Remember.

Termination of Mechanic's Lien for Repairs by Voluntary Surrender.—A mechanic employed to make repairs on an automobile voluntarily surrendered possession, without payment, in July, 1912, and the machine remained in the possession of the owner until December following. It was then voluntarily carried to the mechanic's shop for other repairs. When the later repairs were finished, the mechanic refused to surrender the machine until the debt for the July repairs was paid. In an action by the owners it was held the mechanic's lien for the earlier repairs under the Texas statute was lost, though the rights of no third person had intervened. —Ford Motor Co. vs. Freeman, Texas Civil Appeals, 168 S. W. 80.

Waiver of Condition Against Assignment of Agency Contract.—A contract between the distributors of an automobile for a territory and a sub-agent for the purchase and sale of automobiles provided that no right under the contract should be assigned without the distributors' written consent. The sub-agent, however, after organizing a corporation to operate his business, assigned the contract to it without the distributors' consent. The corporation subsequently took one or more automobiles under the contract, and an account was stated between the parties. In an action on the account stated, it was held that these facts constituted a sufficient consideration for the defendant's waiver of the right to object to the substitution of the corporation for the subject under contract. The defendants pleaded in recoupment that the plaintiff had breached the contract, and one of the defendants testified that they had always been ready and able to deliver cars to the plaintiff as called for under the contract. It was held that the burden was on the defendants to prove the fact, and judgment for the plaintiff was affirmed —Barker Auto Co. vs. Bennett, Massachusetts Supreme Court, 106 N. E. 990.

Breach of Warranty—Buyer's Remedies.—The automobile was consigned to the seller and a bill of lading with draft on the buyer for the purchase price was assigned to a bank. The buyer was thus compelled to pay the purchase price before getting possession of the car. The fact that he did so did not preclude him from thereafter bringing suit to recover for breach of warranty. If the sale had not required the payment of the purchase price before delivery, the buyer could have (1) rejected the car and entered suit for damages for breach of contract, or (2) paid the price, taken the car, and recovered the difference between its value in the condition received and the value of the car required by the contract. Having of necessity paid the price it followed the latter course. The fact that the buyer sold the automobile after notifying the original seller of the breach of warranty, and took in part payment another car, did not preclude his right to recover for the breach of warranty, since the value of the car taken in payment could be determined, and the amount received by the original buyer for the defective automobile thereby ascertained.—Mobile Auto Co. vs. R. W. Sturges & Co., Mississippi Supreme Court, 66 So. 205.

Scope of Chauffeur's Employment.—A chauffeur, while driving his employer's automobile, was permitted by the latter to use the machine in going to his dinner at the home of a third person, and from there to a shop of the third person on his way to a school to carry home his employer's children. The chauffeur, instead of going to the third person's shop directly to the school, by the usual route, took a longer route to carry another towards the place to which the latter wished to go, but in the general direction of the school. While on his way, he ran into a pedestrian, who sued his employer. It was held that the issue whether the chauffeur acted within the scope of his employment while so driving from the third person's shop was for the jury, and, if they found that he acted within the scope of his employment, the defendant was liable for the result of the chauffeur's negligence. The chauffeur testified that after the accident he told his employer the whole story, and the latter said that the chauffeur had a right to be where he was when the accident happened, and that there was nothing for him to worry about. It was held that, if this was true, the fact that the chauffeur had also the purpose of gratifying a private desire of his own in taking the route that he did was immaterial.—McKeever vs. Ratcliffe, Massachusetts Supreme Court, 105 N. E. 552.

Sales and Condition When Shipped.—Suit was brought for breach of contract for the sale of certain second-hand automobiles by the defendant to the plaintiffs. The machines were to be put in good running condition f. o. b. cars at Kansas City, Mo., for shipment to North Dakota, to be there retailed. The evidence showed that the condition of the machines when received in North Dakota was such that they must have been in that condition when shipped by the seller. It was held that evidence of the running condition of the machines at destination was admissible to show their condition when loaded. An instruction that if two of the machines when loaded by the seller were not in good running order, and were unfit to be used for the purpose for which they were bought, and if the buyer was unable to sell them on account of their condition when shipped, the seller was liable, was held not to be objectionable as leading the jury to believe that an implied warranty of fitness for a particular intended use existed. The clause as to unfitness was not inserted as a ground of recovery. It bore solely on the question as to the value of the machines if they were not in good running condition when loaded for shipment. Moreover, the court charged that, if the jury believed that the seller loaded the automobiles in good running condition, the verdict must be for him, regardless of their condition when received at destination.—Kelly vs. Times Square Automobile Co. (Mo.) 156 S. W. 62.

Sale or Consignment.—In an action by a tire company on a contract to furnish tires the principal question was whether the contract was one of con-

Digitized by Google

signment or one of sale. It recited that the company, an Ohio corporation, being desirous of extending its business in Texas, agreed to furnish the defendant, a Texas corporation, solid and cushion rubber tires on consignment to the amount of $6,000, and obligated the defendant to store and hold the goods in its name and under its control under the conditions named in the contract, and promote the sale of the goods. It provided that the defendant should keep the goods furnished it insured in the plaintiff's name, the policies to be sent to the plaintiff. It stipulated that the defendant was to sell the goods and report to the plaintiff on the first day of each month all sales made, together with a scale or weight inventory of the stock in hand, from said "consigned stock," settlements to be made on the 10th for all goods sold the previous month, allowing 2 per cent. as a cash discount. The price was agreed upon, with provision for rise and decline therein; and the defendant was bound to furnish a bond for $5,000. The contract concluded with a stipulation that, if there was no renewal thereof at its expiration, the defendant would purchase the stock of tires then on hand and unsold. It was held that the contract was one of consignment to sell on commission, and not of sale; the general property in the goods remaining in the consignor. The fact that the tires were billed to the consignee as if sold to it did not affect the question. The transaction, therefore, involved interstate commerce, and the statutes of the State of Texas requiring foreign corporations to procure a permit to do business there, and depriving it of the privilege of maintaining a suit in any of the courts of the State, if it failed to do so, was not applicable. And since the manufacture and delivery of the tires constituted an interstate commerce transaction under the contract, it was not a violation of the Texas anti-trust laws because of a provision in the contract that the consignee would sell no other solid or cushion tires.—Stein Double Cushion Tire Co., vs. Wm. T. Fulton Co., Texas Civil Appeals, 159 S. W. 1013.

Guaranty and Acceptance of Offer of Settlement.—Action was brought by the purchaser of an automobile for breach of guaranty. As a part of the trade the purchaser had received the seller's guaranty of freedom from defect in materials and workmanship for one year from date of delivery. He claimed that he discovered certain defects in the car, which were covered by the guaranty, and so notified the seller. The parts claimed to be defective were various bearings, in one of which, the crankshaft bearing, a ball was broken. The parts alleged to be defective were shipped to the defendant, in accordance with the terms of the guaranty. The defendant denied any liability whatever, except possibly for the crankshaft bearing. Several letters passed between the parties, and finally the defendant wrote the plaintiff a letter in which, while denying liability, it proposed to replace certain parts without charge and to furnish other parts at cost. The plaintiff telegraphed in reply as follows: "Ship, first express, complete set bearings through Sub-agent C. A. Welch, for my car." The bearings were shipped accordingly, and billed to the plaintiff in accordance with the terms of the offer, namely, at cost. The defendant contended that the plaintiff's telegram was an acceptance of its offer, and that the offer and the telegram constituted an accord, and the shipping and receipt of the new bearings a satisfaction, of the claim of the plaintiff under the guaranty; that it was, in effect, the substitution of a new contract under such conditions as to be a waiver of the claim under the guaranty. It was held, as a matter of law, that the defendant's offer was so clearly intended as a proposition of settlement that the plaintiff was bound, under the circumstances, so to understand it, and a verdict was directed for the defendant.—Horigan vs. Chalmers Motor Co., Maine Supreme Court, 88 Atl. 357.

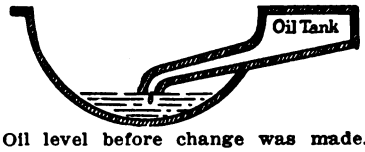
Breach of Agency Contract.—A distributor which handled the whole output of an automobile manufacturing company entered into a contract with an agent, by which the distributor, in consideration of an order for 420 cars, gave the agent the exclusive right to sell all styles of the manufacturer's cars in certain counties in the State of New York for a certain period and the agent agreed to sell only such cars. In an action by the agent against the distributor for breach of this contract the defendant counterclaimed for and was awarded damages on account of the sale by the plaintiff of a large number of automobiles manufactured by other concerns. The contract provided that shipping specifications for each month's allotment should be given by the agent thirty days in advance, and if not received by that time the distributor should have the right not to furnish the allotment for that month. It was held that, as by the terms of the contract no shipment could be made without the agent's order, that was a condition precedent without which a physical tender of the cars was not a necessary condition of recovery of damages by the distributor. The contract provided that the agent should, on the signing of the contract, "deposit $1,500 on each bill of lading, f. o. b.," the amount of deposit on each machine being deducted from draft as shipments were made, and that if the agent rejected or refused to accept or pay for any cars, all deposits theretofore made by him should be long to the distributor as liquidated damages for breach of the contract, and thereunder only one deposit of $1,500 was made. It was held that, since the parties had not insisted upon strict compliance with the contract, the distributor's recovery was not limited to the $987 remaining as the balance of the first deposit. Under New York Personal Property Law, Section 145, as the price of the automobiles was established by the distributor, so that there was no available market or market price, the distributor was entitled to recover the profits lost by reason of the breach, i. e., the difference between the price agreed to be paid for the cars not taken and the cost to him of furnishing such cars.—Poppenberg vs. R. M. Owen & Co., 146 N. Y. Supp. 478.

Breach of Warranty and Buyer's Remedies.—The sellers of an automobile guaranteed the car fully for one year. The buyer, in an action for part of the price, set up as a defense breach of the warranty and asked for damages and rescission of the sale. It was held that the guaranty was not a mere agreement to make repairs, but was also an agreement that the automobile was so well constructed that it would stand proper use for one year, and that they would become answerable for any defect that might occur during that time not due to improper use. The measure of damages in such a case would be the difference between the actual value of the car and the value which it would have had at the time of the sale if it had been as represented. Two courses were open to the defendant when he discovered the

Digitized by Google

defects in the car and decided to rely on an express warranty. He could return the car and plead the rescission of the contract as a defense to the action for its price and counterclaim for the amount already paid, or he could keep the car and counterclaim for damages. He could not maintain both defenses, and as he relied primarily on rescission the case was decided on the principles applicable to that defense. The evidence was undisputed that the break in the frame, claimed as the breach of warranty, occurred during ordinary use. The defendant did not immediately attempt to rescind the sale when he discovered the defects, but demanded that the car be made right and allowed the plaintiffs to make repairs on it. In such cases the injured party must act promptly, as soon as he discovers the supposed breach of warranty. If, knowing that the car was not what he had a right to expect, he still retained it, he was precluded from asserting a right to withdraw from the transaction altogether. Judgment for the plaintiffs was affirmed.—Miller v. Zander, 147 N. Y. Supp. 479.

Contract of Employment.—In an action by an employe against his employer, which was engaged in the business of selling motor cars, for damages for a wrongful discharge, it appeared that on July 1, 1912, the defendant employed the plaintiff to act as general sales manager at a fixed salary and a commission on each car sold and delivered within a certain territory. The agreement contained the following clause: "It is also understood that in the event of your failure to contract for and sell 25 cars on or before October 1, 1912, while in our employ, this agreement can be cancelled at the option of the J. M. Co." The defendant discharged the plaintiff on October 2, 1912, on the ground that he had not sold the stipulated number of cars. The plaintiff put in evidence ten documents, called "dealer's contracts," which provided for the sale of about 190 cars, the dealer making a deposit of $200, from which was to be deducted $20 upon each car when shipped. It was also provided that if the dealer failed to sell the specified number of automobiles, the balance of the deposit money would be applied to charges due the distributor, refunded to dealer, or applied to next season's line. The distributor (the defendant) reserved the right to cancel this agreement at any time, returning the deposit money. There was therefore no obligation on either party to carry out the agreement, and no liability for damages for failure to do so. It was held that these agreements did not comply with the contract of employment, and the defendant could exercise its option to discharge the manager.—Laciar v. Jackson Motor Co., 147 N. Y. Supp. 584.



Side Line Work for Garages.

From the Woodside Garage, New Jersey.—Some time ago we read in one of the trade journals that many small town garages make a practice of manufacturing parts for outside concerns when their lathes and drill presses are not in use in their regular garage work. Can you give us any information along this line? Our reason for requiring this information is that we have a first class lathe and drill press in our shop that is idle a considerable part of the time and we wish to keep it going as much of the time as possible. Inasmuch as we are in a small town, and we do not have very much machine work, we would like to try and see if we can make arrangements to manufacture parts for anyone requiring such service. Our lathe is nearly new, has a 11-inch swing, 5-foot bed, compound rest and automatic feeds. The drill press is new and has a table that easily takes work 15 inches in diameter. In addition we have a good line of drills, reamers, etc., such as naturally would be found in any well-equipped garage and machine shop.

We have the experience to turn out strictly high grade work, and can furnish A1 references if necessary. We would appreciate very much any information you can give us along this line.

For the Maxwell Lubrication.

From A. K. Wheeler, Holyoke, Massachusetts.—Referring to inquiry No. 1697 by Mr. Coy P. Smith, in the October number. Mr. Smith complained about using too much oil in his 35-4 Maxwell car, 1913 model. I have a 1914 Maxwell car, and I have run it 22,000 miles to date. I average one quart to a hundred miles, which I consider a good, reasonable amount of oil to use. Mr. Smith must understand his oiling system, and remember that it is what is called a vacuum system, and that the tank that holds the oil must be perfectly tight. I think this is

Oil level before change was made.

Oil level after change was made.

his whole trouble, namely—air leaks around the filling plug, so that the oil leaks out of the tank into the crank case, and is burnt up and carbonizes in his cylinders. He should see that there is a good soft leather gasket under the filling plug, and that this plug is down tight so as to prevent any air from getting in. When this is made tight, I do not think he will have any more trouble, unless there is a leak somewhere else, so that the air gets into the oil tank and permits oil to run into the crankcase.

Drill down through the end of the nozzle and drive in a piece of copper tube, taking great care not to stop up the oil way from the tank. Make sure this is free and the oil will run through freely. Screw a ⅛-in. pipe plug in the top of the oil nozzle to stop up the hole in the top that you had to drill to get in the piece of tube. Let the tube stick down below the oil nozzle the required length, as the oil level in the crankcase will be determined by the end of the tube. This is all shown in the accompanying sketch.

To get the desired level, put a straight edge across the bottom of the cylinder and with the connecting rods at the lower end of the stroke, measure how far below the bottom of the cylinders they come, then put the straight edge on the crankcase and measure down to the end of the tube you put into the oil nozzle. This will tell you how far the ends of the connecting rods will dip into the oil. After all has been connected up and the engine has been run long enough so the oil level is correct in the crankcase, remove the breather pipe on the left hand side of engine, and run the engine. You can then

Digitized by Google

see in through the opening for the breather pipe to the crankcase, to see if the rods are throwing sufficient oil to lubricate the engine properly. I hope I have made everything clear and that Mr. Smith will be able to correct his trouble.

CARBON MONOXIDE.

Further Information as to the Dangers of a Deadly Poison.

From Lester Curtis, Illinois.—The excellent article by Dr. Van Patten in your September number, on the pathology of carbon monoxide poisoning, pleased me, but it does not cover all the ground. Perhaps a few more facts may make the matter clearer and may not be uninteresting to your readers.

As Dr. Van Patten says, the gas makes the blood corpuscles incapable of performing their function; i. e., that of carrying oxygen to the tissues. This function is the most important and necessary function in the body, for if the cells are deprived of oxygen they cease to act, and death promptly follows. Dr. W. H. Rand (Bulletin of the Bureau of Labor, 1912), says, "All the blood charged with this poison is virtually destroyed as surely as if it had escaped from a severed artery. So if a considerable proportion of the blood becomes saturated with this gas, death is inevitable, not by suffocation as commonly imagined, but by carbon monoxide poisoning."

But the destruction of the blood corpuscles is by no means the whole of the injury done. Dr. Thompson (The Occupational Diseases,) says, the gas "also possesses a second and more important toxic effect upon the central nervous system, of the nature of a narcotic and depressant, for the effects are manifest even when there is still a large percentage of red cells carrying oxygen, and they often persist long after the CO (carbon monoxide) has left the blood." One of his patients had red corpuscles in the blood equal in number to that of high health, with 95 per cent. oxygen carrying capacity, and in all other respects it appeared quite normal, "yet he died two days after in coma."

Dr. Thompson examined the brain in twelve of his fatal cases. In all of these the brain was damaged, and in the cases "who had survived long enough for it to occur," actual destruction of brain tissue had taken place. In cases that got well, "recovery was slow and for some days the patient may suffer from mental weakness."

Krasek and Apfelbach reported before the Illinois Commission on Occupational Diseases, a study of 240 men who were suffering from chronic carbon monoxide poisoning from emanations in a foundry. They say of these men, "Many of them were in poor physical condition with reduced muscular strength."

Dr. George Gulland of Surgeons Hall, Edinburgh, states that "chronic gas poisoning is known to have been causally associated with pernicious anæmia."

Dr. Mary O'Mally (Transactions of International Congress on Hygiene and Demography, 1913,) reports a case of prolonged mental disturbance following carbon monoxide poisoning in a healthy young woman. The girl was treated ten days for the poisoning, in the Geo. Washington Hospital, Washington, D. C., and discharged as fully recovered. After about three weeks she began to show signs of disturbed mentality. Thirty-eight days after the occurrence of the poisoning she was admitted to the Government Hospital for the Insane and remained there four months, when she was discharged, apparently well.

A number of cases have been reported, of loss of memory and other mental disturbances after carbon monoxide poisoning; in some cases the disability remained permanently.

Inhalation of even small quantities of the gas, if frequently repeated, may result in serious impairment of health without the cause being suspected.

It is not the closed garage alone that is dangerous; the open garage, where an engine is running, is also a menace. Even the open air, when gas is present, is not free from danger, as in Mr. Ireland's case of a man poisoned to death while being towed behind a gas automobile. The other day a Chicago paper reported the sudden death of some one while driving an auto truck. The suspicion, at least, of gas poisoning, would seem justified in this case of a healthy man so suddenly overcome. A suburban friend who drives into business during the rush hours, suffers from headache and other unpleasant symptoms whenever, as often happens, he is caught behind a smoking automobile.

A MUFFLER STUDY.

Does the Silencer Reduce Power, and If So, Why and How Much?

Manufacturers or inventors of mufflers have been known to claim that by the use of their specialty not only is all back pressure eliminated, but a gain in horsepower on a given engine actually effected. The skeptical doubt the truth of such statements, and argue that in every muffler there must necessarily be back pressure, and that this back pressure must mean loss of power, and, consequently, the best possible muffler is that which combines the effective silencing of the exhaust gases, with the minimum waste of power. To have no loss of power is, they argue, to leave the exhaust gases unmolested and therefore not to reduce the noise they cause, and consequently to claim silence without loss of power is illogical, but to claim it with a gain of power is ridiculous.

But muffler experts still insist in their claims, and in one instance the claim is backed up by an officially observed trial. Who then is right? Paradoxical as it may seem, both claimant and skeptic are right, for it is possible to show an increase of power on fitting a muffler to an engine, although the muffler so fitted (assuming it is a silencer) must necessarily involve back pressure, which is in this case a synonym for loss of power. There is a "nigger in the woodpile" in the form of a loop-hole in the conditions that the experts demand for their tests, and the elucidation of this point will prove of interest to those motorists who have not carefully considered the interesting problem of silencing the exhaust gases.

The loop-hole referred to above is that it is necessary to include in the term muffler the exhaust pipes which lead from the cylinders to the muffler proper, the reason being that an engine which exhausts direct into the atmosphere can have its power increased by the fitting of a suitable plain exhaust pipe, because the atmosphere itself sets up some back pressure tending to hinder the egress of the gas.

It will therefore be seen that there is a margin between the horsepower obtained with and without

Digitized by Google

an exhaust pipe—being greater with one—and that if an efficient muffler can be produced, the back pressure of which does not cause a greater loss of power than that gained by the exhaust pipes, then, when an engine is tested with the muffler and compared as to power with a test where the engine exhausts directly into the atmosphere, it would show a gain in horsepower. But if a third test were made in which the engine was fitted with a suitable and long exhaust pipe of uniform section and easy bends this last would show the maximum power.

Of course, if a muffler can be designed that adequately muffles the exhaust noises and yet has its power losses coming within the limits referred to above, every credit is due to the inventor, and this article is not intended to detract in any way from the merit of such an achievement, but merely to prove the possibility of such a result, which is doubted by many.

The theory which underlies this phenomenon is as follows: The exhaust gases issue from the combustion chamber at a velocity of something like 100 miles per hour, and these striking directly into the atmosphere have to make room for themselves by forcing away the surrounding air which necessarily hinders their progress, thus causing an appreciable loss of power, because to obtain the maximum power it is very necessary to get rid of the exhaust gases as rapidly as possible. Additional power is obtained on racing engines by fitting cams which open and close the exhaust valves more suddenly than on a touring car engine, thus enabling the valves to be open their maximum amount for a minute fraction of time longer.

Let us now consider an engine fitted with a long exhaust pipe made without any sharp bends or other obstructions. An exhaust valve opens and the gases rush down the tube at the tremendous velocity before mentioned; this sets up an action analogous to a piston in a cylinder, the momentum of which pushes out the air in front of it and tends to leave a vaccum in its wake, the result being that the next emission of exhaust gases, instead of having to struggle against the atmosphere as in our first example, now has a path in which all resistance has been removed, and even a partial vacuum helping it on its journey. To obtain this last effect it would be necessary, very judiciously to select the correct length and diameter of pipe, for it would seem that if the pipe were too short one charge of gas might leave the pipe before the next exhaust valve opened thus causing a back rush of air, and again if the pipe were too long there might be a "loitering" effect causing the succeeding charge to "hurry up" the preceding one.

If the above be an exact statement of this phenomenon it should prove a most interesting and valuable subject for a laboratory test to discover the correct dimensions of such an exhaust pipe, and the data for determining them for a given engine.

An ordinary dynamometer, such as is used for the commercial testing of engines, is not sufficiently sensitive for such a purpose, nor would the results taken from one size of engine be of much value, but some tests which, although not of a pretentious or exhaustive nature, are of some interest.

These were made with an ordinary electrical dynamometer and a standard engine having a bore and stroke of 100 by 140 mm. Test one was made with the engine fitted with a standard muffler. In test two the exhaust opened directly into the air, with, it will be observed in the appended table, an appreciable increase in power. For test three there was fitted to the engine long plain exhaust pipes, which ran with easy sweeps into one main exhaust pipe, with the result, it will be seen, that a further increase in horsepower was obtained.

Varying the length of this pipe was tried, but it was not possible to detect any appreciable difference in power, the apparatus not being sufficiently sensitive. The figures given are in every case averages over several readings.

The type of muffler used was a simple one, highly efficient, but absorbing rather too much power. Its main characteristic is an expansion chamber divided by three baffle plates; by removing two of these baffles the intermediate readings, as shown under test four were secured, and although the muffler was not very efficient as a silencer, there was, nevertheless, a distinct muffling of the sound of the exhaust. Thus it was shown that a muffler could be produced which apparently increased the power of the engine.

An interesting feature, incidentally, is the fact that the powers developed in all the tests were approximately the same at speeds below 1,000 r. p. m.; but this is a result which should be expected unless the muffler were very inefficient.

Table Showing the Results.

Engine R.P.M.	Test No. 1, with standard muffler. h.p.	Test No. 2, without muffler or exhaust pipe. h.p.	Test No. 3, with exhaust pipe only. h.p.	Test No. 4, with standard muffler modified. hp.
500	14	14¼	14¼	14¼
750	22½	23½	23½	23½
1000	28½	30¼	30½	30¼
1250	33¼	36½	37¼	36¾
1500	36	40½	42	41
1750	36¾	41¾	44½	42

The following deductions might be usefully drawn: First, that a muffler should always be mounted as far away from the engine as convenient so as to give the longest possible length of straight exhaust pipe. This main pipe and also the auxiliary pipes which lead into it from the exhaust ports should be as unrestricted as possible by having easy sweeps, instead of the common practice of having the exhaust box running parallel with the engine and connected to the cylinders by very short lengths of pipe at right angles to the exhaust box and sometimes coupled to the muffler by another pipe at right angles to the exhaust box, compelling the gas to pass three abrupt or right angle corners. This, as a matter of fact, was how the muffler used in the above tests was connected to the engine and accounts for a great deal of the lost power.

The second point is that, if a cutout be fitted to the system recommended above, it should be placed as near the muffler as possible.

A manufacturer should test his exhaust system in the way mentioned, and should not be content until he is able to get either the same horsepower—or preferably slightly more—with the cutout open on his standard exhaust system as he is able to get with the entire exhaust system removed and the engine exhausting freely into the atmosphere.

Never open the throttle quickly; open slowly and gradually. Close it as quickly as you like. Quick opening strains the engine, upsets the mixture, and does not speed you up.

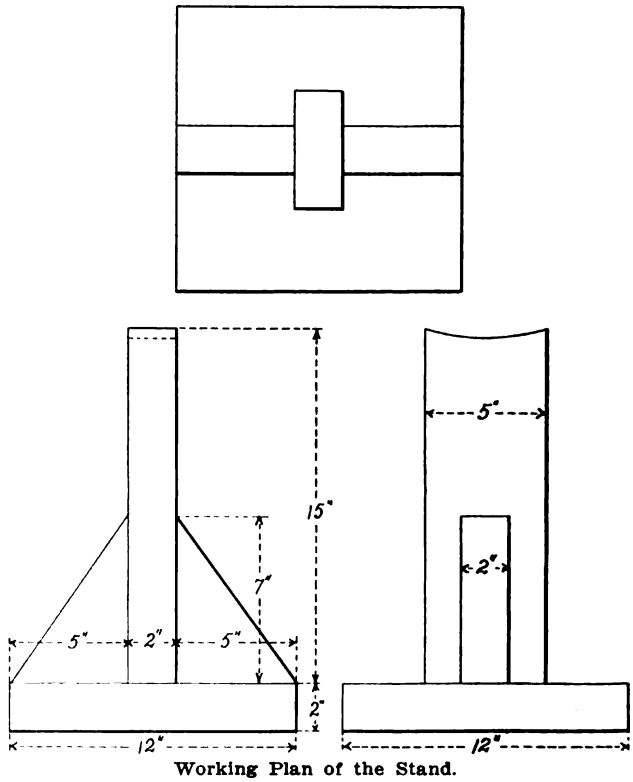
ROMANTIC FIGURES



Well Worth Noting Concerning the Automobile and Its Magnitude.

(From Alfred Reeves, General Manager, National Chamber of Commerce.)

The motor car production for 1916 will exceed.	1,200,000
On the basis that any person with an income of $1,200 can own a car, there is market for automobiles to the number of.....	5,000,000
Motor vehicles sold during 1915.....	892,618
Retail value of cars and trucks sold in 1915..	$691,778,950
Passenger cars sold in 1915.....	842,249
Retail value of passenger cars sold in 1915...	$565,856,450
Motor trucks sold in 1915.....	50,369
Retail value of motor trucks sold in 1915.....	$125,922,500
Motor car sales almost doubled from 1907 to 1908, from 44,000 to.....	85,000
Number of carriages sold annually from 1908 to 1912	1,000,000
Miles of public road in the United States....	2,273,000
Money spent in this country on highway construction last year, which made for tremendous increase in real estate values, almost	$250,000,000
Automobile exports to 80 different countries in 1915 increased 250 per cent. and will exceed	$100,000,000
In 1914 it was.....	$28,507,464
England is our best buyer of automobiles, taking for the year ending June 30, trucks 5,306; pleasure cars 8,321, valued at.....	$21,000,000
Estimated value exports of Commercial vehicles only, 1915 (increase 600 per cent.)..	$63,000,000
Estimated value exports passenger cars dur- 1915 (increase 90 per cent.).....	$37,000,000
Freight carloads of automobiles shipped during 1915 exceeded	200,000
Miles traveled annually by motor vehicles (average of 5,000 miles per car).....	12,000,000,000
Gasoline consumed annually by automobiles (average of 400 gallons per car), gallons.	980,000,000
Lubricating oil consumed annually (average of 12 gallons per car), gallons.....	28,800,000
Tires used annually on motor cars..... ..	12,000,000
Number of brands of tires used on motor cars almost	125
Number of types and sizes of tires.....	140
Motor vehicles registered in the U. S. from State reports July 1, 1915.....	2,070,000
Total registrations for 1915.....	2,400,000
Registered in New York State Dec. 1, 1915...	231,713
Chauffeurs registered in New York State Dec. 1, 1915.....	79,899
Registered in California Oct. 1, 1915.....	160,000
Registered in leading 10 grain States.....	677,000
Total manufacturers of passenger and commercial cars	448
Commercial vehicle manufacturers.....	257
Dealers, garages, repair shops and supply stores	27,700
States in which automobile factories are located	34
Proportion of motor vehicles to population of United States	1 to 48
Proportion of motor vehicles to miles of road.	1 to 1
Proportion of automobiles to area of U. S...1 to	1⅓ sq. miles
Scientific engineering, standardization of main parts, skilled manufacturing, big production and efficient selling brought the passenger car to an average price in 1915 of.	$672
The average price of automobiles in 1899 for steam runabouts was.....	$1,284
The average price in 1907 went to.....	$2,123
The automobile and improved roads in some localities have increased land values, per cent.	400
Automobilists pay registration fees in all States and personal property tax, in addition, in all but four States. Many States also require and charge for a driver's license, while others have a wheel tax. There was paid more than $7 per car in motor vehicle fees for registration in 1915, exceeding	$14,000,000
Keen competition in the automobile industry brought failures in the past five years of.	400
Exports of cars and trucks per month are at the rate of.....	$8,500,000
The industry is rated to have begun in 1895, with the first automobile race over the World's Fair course in Chicago, won by J. Frank Duryea and Charles E. Duryea, in a car of their own make; the time for 55 miles was.....	10 hrs. 28 min.
Iowa leads per capita with one car for every 19 persons, with a total registration of cars of	117,407
In 1899 the production was.....	3,700
Value of cars in 1899.....	$4,750,000
In 1903 the production was.....	11,000
Value of production in 1903.....	$12,650,000
Big production came with the standardization of the most important parts of cars in 1910, when the number of cars made reached	187,000

For Jacking Up the Car.

Although the majority of motorists use their car the year around, some store them during the more severe winter months. As the wheels should be jacked up so that all weight and strain be removed from the tires, jacks or stands must be utilized. An easily made and inexpensive stand is shown in the accompanying drawing, and as the dimensions are given, no trouble should be experienced in its construction.

Working Plan of the Stand.

As may be noted, the base is made from a piece of two-inch plank, 12 inches square, and fitted to this is an upright, the top part of which is recessed. This groove is essential, as it will prevent the axle from sliding off the support. The upright is made of a piece of 2x5 joist, one end of which is nailed to the base piece. The upright is made substantial by using two triangular braces, five inches wide and seven high.

In connection with the work of jacking up a car,

Digitized by Google

attention is called to the importance of setting the brakes before using the jack, so that the machine will not roll, and to the placing of the stands under the axle and not the truss rod or brake mechanism.

His 1911 Model Runs Well.

From Albert Lentz, Michigan.—I own and drive a Cutting car, 1911, model D, 40, and have driven the car four seasons, and it is always dependable under any and all conditions. It is equipped with a model L Schebler carburetor, which is one of the best made. It can be adjusted easily and always responds to the touch of the throttle and is quick to pick up. Now this car, being one of the older types, has to be cranked, but never coaxed. I have never had to use any hot water in order to start the motor in any kind of weather. It always starts with one or two pulls of the crank and I don't need to do even that if I don't want to. I can prime the cylinders about five minutes before I wish to start, and then when I am ready to go I push the button and the motor will start in any kind of weather, and after I start in this way, and the motor is hot, I can start on the button every time I stop for anything. Of course I had to put on a hot air hose and it has to be five feet long, as the exhaust is on the opposite side of the motor that the carburetor is on. I have 18 inches of contact besides a hot air pocket, 6 inches long on the end of the hose, all securely wound with asbestos to hold the heat, and this air is hot and vaporizes the gasoline quickly. Now about the motor. It is 4 by 5 and never misses fire, unless a spark plug gets cracked, as has happened a couple of times with me and I replaced them with new ones. I always have enough power and don't know what trouble is so far as ignition is concerned. I think, taking the age of the car to account, that it is a "hummer," as it runs fine and never balks on any road. I never race with anyone and if the other fellow wants to go faster I let him pass. There is one peculiar thing about my motor. It fires 2—1—3—4. An expert looked at it and said that he would not wire a motor that way, but as long as it runs good it would not make any difference. I do not know much about timing a motor, but understand the machinery parts and do about all of my own work. I drive about 14 miles on a gallon of gasoline, and my car weighs 2,800 lbs. I think, taking everything into account, that I have a good car and don't have to weary you with my questions this time, at least. I would like to hear from other car owners that can give as good a report as I have given. My car has a Remy magneto and coil and gives a hot spark. I use spark plugs with ½ inch extension, so the firing points are deep into the mixture. Last season I had to put in new platinum points as the old ones melted away. I am using my last year's dry cells and they only test 6 amperes. There are four of them and one of them doesn't test anything, but it will start the motor.

"Main Street" of the Nation.

The widespread interest that has attached to the amazing development of the Lincoln Highway in the two years since the idea of its construction was given to the public is responsible for an increasing demand on the part of the people for knowledge concerning road conditions in every part of the country. Were all the highways in the United States being developed as rapidly as the Lincoln Highway, some startling figures in the way of expenditures for such improvements might be quoted. Figures which really show the expenditures for road improvement during the past year and for the past decade are just as interesting as they show the necessity for immediate constructive endeavor. Ten years ago when the good roads movement was just beginning to enlist public support, approximately $79,000,000 was expended by states, counties, towns and districts in the United States in furthering the cause of improved highways. Through the awakened appreciation of the advantages of good roads since that time, due in no small part to the Lincoln Highway Propaganda, the amount has jumped to $235,000,000 for the last year. This includes the $4,623,800 which, in round numbers, were spent in improving the Lincoln Highway. The Lincoln Highway is 3,384 miles long, while the United States has, as a whole, 2,240,000 miles of public roads including the Lincoln Highway.

In comparing these figures, it is very apparent that the Lincoln Highway has received its share of attention as far as the percentage goes, but there is every reason in the world to continue the endeavor to complete the Lincoln Highway as soon as possible since it stands as the most certain example of what connected road improvements should be, for the rest of the country to follow.

However, through the interest which is centered on the construction of the Lincoln Highway many similar highway organizations have come into life since its inception, and public demand for good roads is becoming more and more insistent in seeing larger sums appropriated for highway improvement.

Economical Touring.

From the Skyland country of Colorado to the expositions of the Pacific Coast at a total cost of $40 for subsistence and automobile expenses, as compared with railroad fares, sleeping cars and meals costing $372 is the splendid record of a Hudson trip. That is the experience of J. W. Cary and family of four, who were accompanied on the trip by Dr. J. V. Solandt, all of Salt Lake City.

The Lincoln Highway was used from Salt Lake City to San Francisco, via Los Angeles. The homeward journey will be by way of the National Old Trails, visiting Grand Canyon, Petrified Forest and other scenic features of that road, crossing eight mountain ranges in Northern Arizona, and over the Transcontinental Divide at 8,214 feet in the westerly portion of New Mexico.

Between New Mexico and Colorado they will again drive their Hudson car over the high summit of Raton Pass and after a visit to the Royal Gorge and the Garden of the Gods will make the final homeward lap by way of Berthoud Pass, crossing the summit at an elevation of over two miles above sea level.

Night Road Accidents.

A Massachusetts paper advances the explanation for so many automobile accidents in that State at night that chauffeurs take naps at the wheel while the machine is spinning along. The paper says drivers wearied by long hours doze off and something happens. There is no doubt something would happen if there was any dozing or if chauffeurs even indulged in 40 winks to rest their tired minds and bodies. In the city drivers have no chance to sleep

Digitized by Google

while on the go, but on a smooth country road at a late hour there may be momentary slumber. But three other contributing causes of night accidents cannot be ignored. They are a drop or two to drink, darkness and the blinding headlights of cars coming from an opposite direction.—Brooklyn Standard Union.

MAGNETO OR BATTERY.

Claims That the Generator Is the Best Source of of the Ignition System.

Frank Concord to the New York Society of Automobile Engineers.—The mechanism for igniting the charge in the cylinder of an explosive engine is one of the foremost problems of design with which the automobile engineer has to contend. Its general development is one of evolution, a condition which is true of all new problems in engineering.

The ignition mechanism on the early automobile engines was copied from the system as used on stationary engines of that day. This was the so-called make-and-break system in which an electric circuit was mechanically closed and opened through contact points placed inside the cylinder. The electric circuit usually consisted of a simple reactance coil in series with a few cells of primary battery. The inductive discharges from the coil produced a spark on separation of the contacts which ignited the charge in the cylinder. Under limited conditions this system leaves little to be desired. The electrical apparatus is simple and easily understood. The ignition spark is very hot and if the mechanical part is well made its operation is practically perfect.

Advantages of Jump-Spark System.

The next scheme to be proposed was the jump-spark or high-tension system in which the spark electrodes in the cylinder are fixed with a small separation between which the spark is produced at the proper instant by applying a voltage sufficiently high to jump the gap. This arrangement has the advantage that there are no working parts in the combustion space and therefore the parts are mechanically much more simple than the low-tension system. This system had the apparent disadvantage of giving a much weaker spark, and owing to the high voltage this spark might be further weakened by leakage between the parts forming the terminal supports and the connecting wires. These problems were more readily solved than the ones connected with the make-and-break mechanism. In fact, it can be stated that the modern high-speed gasoline engine would be impracticable with make-and-break ignition. For the slow-speed stationary engine, especially where, due to a low grade fuel being used, compression is carried to a high value, the low-tension system has, however, held its own.

In the high-tension system the mechanism connected with the sparking points has been simple and the problem of insulation of these points has been solved to a satisfactory degree. It is, therefore, upon the mechanism which furnishes the high-tension current at these points that our attention is now centered. The first and most obvious solution of this problem was to use an ordinary vibrating contact induction coil, the primary circuit of which was supplied from a primary battery, and in the secondary circuit of which was induced a voltage sufficient to jump the space between the electrodes in the cylinder, these electrodes and their mounting forming the now well-known spark plug. The primary circuit of the induction coil was controlled by a contact device which served to close this circuit at the proper instant. The shortcomings of this system were mainly in the battery which supplied the electric energy to the coil, and in order to obtain a reasonable life from the type of batteries available for this service, it was necessary to reduce the energy consumption to the minimum that would give satisfactory ignition. To overcome this defect, designers turned their attention to the matter of supplying this energy from a mechanical generator which would obtain its power from the gasoline engine. As the only object of this generator was to supply energy to the induction coil, it was evident that this coil and its contact mechanism would be combined in one piece of apparatus with the generator.

Ignition by Single Spark.

As a simple alternating current generator which gave a comparatively low frequency was used, it was found necessary to abandon the magnetically operated vibrator and substitute a mechanically operated one which would open and close the primary circuit of the induction coil at definite points on the voltage wave induced in the windings of the generator armature. This, of course, gave but one spark in the cylinder instead of the series of sparks induced by the vibrating coil, but as it is necessary to obtain proper timing of the explosion that the first spark ignite the mixture, the succeeding sparks are superfluous, although it is possible that should the first spark, owing to unfavorable conditions, fail to ignite the explosive mixture, a succeeding spark may do so. This condition can be practically overcome by supplying more energy to the single initial spark, which is permissible when this energy is generated by a mechanical device.

As a generator with permanent magnet fields gives the simplest arrangement and has the advantage of overcoming the time element necessary for any electromagnet field to be built up, the permanent type is universally used and the name magneto has by usage in automobile engineering circles been taken to cover generating and spark producing mechanism as a whole.

The advent of electric lighting, and later of electric starting of the gasoline engine, produced demands for electric energy on the automobile which could only be met by the use of a much more efficient type of generator than that which served for the supply of ignition energy. As it is necessary to have power when the engine is not running, a storage battery is required. This condition is being met by the variable-speed battery-charging generators now on the market. The presence on the automobile of a supply of electrical energy much greater than required for simple ignition seems, therefore, to render superfluous the use of a separate generator for the ignition system. Naturally, in view of this, the first impulse would be to go back to the original vibrating coil system with its primary battery energy being supplied from the lighting and starting system instead. This system, however, has certain disadvantages which have been in large measure corrected in the development of the magneto generator, the principal ones being the time which elapses between the closing of the primary circuit and the production of the spark at the plug

Digitized by Google

and the limitation which the vibrating contact mechanism places on the amount of energy it is possible to deliver to the spark plug. As this time is constant and independent of engine speed, it is obvious that the spark would occur progressively later as the engine speed increased. To overcome these defects it has been necessary to design a mechanism in which the primary contact points are operated mechanically the same as in the case of the magneto. As the spark is produced at the opening of these contacts, and this opening occurs at a definite angular position of the engine crankshaft, the spark is not retarded as the speed increases, thereby necessitating only the amount of angular advance required for the complete combustion of the exploding charge, and the type of contact device also permits of increasing the amount of energy which may be delivered to the spark plugs. The remaining distinction between the operation of a magneto and a battery system lies in a difference in the action which takes place in the induction coil.

Energy Conditions in Battery System.

In the battery system the total energy to be supplied to the spark plug is delivered through the primary winding of the induction coil and stored as magnetic energy in the magnetic circuit of this coil. On opening the primary circuit this energy, minus the incidental losses, is delivered through the secondary winding to the spark plug. An oscillograph curve of the current in the spark plug circuit shows that this current rises instantaneously to a definite value from which value it gradually falls off to zero. The amount to which the current rises is determined by the value of the primary current and ratio of primary to secondary turns; while the time required for this current to fall to zero is determined by the energy stored in the magnetic circuit of the induction coil and by the resistance of the secondary or spark plug circuit.

In the case of the magneto the initial current value through the spark plug is, as in the case of the coil operated from a battery, determined by the primary current and ratio of turns. Its subsequent value, however, may be modified by the fact that energy can be delivered directly to this secondary through the mechanical motion of the generator armature itself. The time required for the current in the spark-plug circuit to reach zero may, therefore, be prolonged over that which would be possible in the case of the simple induction coil system. So far as performing its function of igniting the explosion charge is concerned, this prolonged spark can be of no value as, in order to properly develop the power in the cylinder, the combustion of the charge which is started at the spark plug points must take place through the whole volume of charge in an extremely limited time as compared to one complete engine cycle. No increase of power could, therefore, be obtained by maintaining the spark at the spark plug points after the explosive mixture in the vicinity of these points has been burned. This effect of prolonging the duration of spark may be very deceptive in comparing the relative intensities of the spark produced by different systems by observation. Thus, a greatly prolonged spark of comparatively low current value may appear much hotter than one of short duration but higher current value, although this latter would be the more efficient igniting spark.

Limitations in Magneto Voltage.

A further distinction between magneto and battery ignition lies in the limitations on possible secondary voltage it is practical to generate in the magneto equipment, especially at the lower engine speeds. In the battery system it is possible to wind the secondary coil for any required voltage. In the case of the magneto there are limitations of design, due particularly to the limited space in which it is possible to place a secondary winding and the difficulty of obtaining clearances necessary for effective insulation. This condition can be observed by noting the size of the magneto required to give efficient ignition when the jump-spark system is used on the comparatively slow-speed high-compression stationary engine.

I have not gone into any details of the construction or operation of either the magneto or the battery system, as it can be seen from the foregoing that there is no fundamental difference between the two systems, and the method used to work out the problem of any particular design would have no bearing on the question under discussion. That the ignition system in which the primary source of electrical energy is the generator, which can supply in common all electrical demands of the automobile, is the most rational solution, is evidenced by a study of changes in the types of equipment used within the last few years.

SKIDDING DANGERS.

How to Prevent Them and How to Handle the Car.

F. W. Muller in the N. Y. World.—Ask the average motorist what he fears most in the daily handling of his machine and the answer will be "skidding," for if there be one thing more than all others that the motorist fears, it is that sickly sinking of one's interior that comes with the sudden and entire loss of control inevitably accompanying a bad skid.

Skidding is the result of the failure of one force to counteract another—in other words, the momentum of the machine is in excess of its traction. The tendency of the heavy, moving body overcomes the adhesion of the rear tires, and they slide in the direction they were originally moving, instead of following the path of the front wheels, as skidding almost invariably has its origin in an attempt to alter the direction of travel when on a slippery surface. Except on a high-cambered country road, where the whole car naturally tends to gravitate sidewise into the ditch on the least provocation, it rarely occurs when driving straight ahead. Consequently, the first precaution to be observed is to drive slowly over the occasional stretch of wet asphalt. "Gingerly" describes it better—feeling your way carefully, so that the momentum of the car will not be sufficient to overcome its traction when necessary to go around an obstacle.

As an absolute preventive of skidding non-skid chains will naturally suggest themselves at once to the reader, and it may be added that two of the insurance companies that write automobile accident policies have taken cognizance of the frequency of accidents caused by skidding, and recommend the use of chains. In truth, if the chains are in their proper place on the tires, our "ever-present danger" has been exorcised, so that the remarks which fol-

Digitized by Google

low may be taken merely as advice for that day when somebody forgot, and left his chains in the locker at home. And right here we can offer the best anti-skid rule of all: make it an invariable rule to keep the chains in the car, and not trust to remembering to put them there just before starting out.

A slow pace will also obviate the necessity of using the brakes in the majority of instances, for braking is one of the things that should be avoided by all means when attempting to regain control during a skid, as, if the rear wheels can be made to resume their usual function of rolling after the front ones, the slide will be over. The average motorist's first impulse is to jam on the brakes hard, with the result that the driving wheels immediately lock, and continue to travel sidewise on the small section of the tire that lost its traction and caused the skid in the first place.

If it be possible to avoid the use of the brakes and the front wheels be thrown immediately in the same direction as the rear of the car started to slide, the tendency to keep up this process until the car lands up against the curb or some other equally unpleasant obstruction will be counteracted, and its progress crabwise arrested. For example, if, in attempting to pass another vehicle to the left, the rear wheels refuse to take part in the manoeuvre, but start on a swing for the curb at the right, the steering wheel should be immediately swung in the same direction, thus presenting the four wheels of the machine as a broad "V" against the sliding action. The latter then has to overcome the friction of four wheels, instead of being aggravated by a snap-the-whip action, which results when the steering wheels are turned in the direction opposite to that of the skid. Once the rear wheels refuse to follow the front ones, they must take a path of their own, and they are naturally restricted to the arc of a circle having the middle of the front axle as its center and the wheelbase of the car as its radius. Hence that unpleasant and sudden swing which so often results in "sidewiping" the nearest obstruction, or causes the car to face back in the opposite direction when the road happens to be clear. Both of these can usually be counteracted effectively by letting the brakes alone and using the steering-wheel, in the right direction, which is always that of the skid itself.

Granted, of course, that the speed was sufficiently moderate to keep things in hand without the necessity of jamming on the brakes, this precaution applies only to the common or garden variety of skid, in which the back wheels alone are the culprits. Where the pace is overfast, considering the slipperiness of the surface, the energy of the moving body cannot be absorbed in a short distance either by the brakes or the turning of the steering wheels to counteract the slide. Then occurs that most to be dreaded of all skids—the "sashay on all four," against which only a swift mental appeal to Providence and a resolution to use the tire-chains next time are of any avail. The rolling momentum of the car is transformed into a force that sends the whole machine along sidewise, its progress aided by the locking of the rear wheels, and the driver finds himself utterly helpless.

As a producer of skids of the most virulent type, street car tracks are way above par. If there be a reasonable coincidence of their level with that of the roadway, little difficulty is experienced in getting off them when dry, but when wet the driving wheels will bind sufficiently to make it hard to release them except by turning the steering wheel much further than would be necessary under ordinary circumstances. The result is to bring them out with a jerk and the nastiest kind of a swing around follows; unless the street be clear, nothing but pure and unadulterated luck can save you from hitting something; and even if there are no wagons or pedestrians, street cars or other impedimenta there is still the curb to be reckoned with.

As the only sure and dependable means of preventing skidding, anti-skid chains stand supreme. Always have a set with you. They are easy to put on and easy to take off, and the element of safety they add makes them well worth while.

Overheating.

The two main causes of an overheated motor are defective carburetion and ignition. In the first case it may be that too rich a mixture is being supplied to the engine due to a defect in the carburetor such as worn toggles, punctured float, leaky needle valve, loose jet, etc. The carburetor may be of the type that is heated by the circulation of water from the cylinder jackets. During the summer months this hot water jacketing of the carburetor is frequently unnecessary, and may cause the carburetor to get too hot for efficient carburetion. There is usually a tap fitted in the pipe line that conveys the hot water to the carburetor, and this should be turned off and any improvement noted.

If the carburetor is supplied with hot air drawn from round the exhaust pipe by means of a "muff," a good sized hole should be made in the pipe between the carburetor and the muff and a sliding collar or clip fitted to cover the hole up when not in use. The hole should be made near to the carburetor, and should be opened in hot weather in order that cooler air may be drawn in. If the air for the carburetor be drawn through a filter the gauzes should be frequently removed and thoroughly cleaned, as any strangling of the air supply will cause more suction on the jet and more gasoline to be used.

Now as to the ignition, the brushes of the magneto high-tension circuit should be cleaned, and the platinum points examined to see that they are separating, when the rocker arm makes contact with either of the cams or rollers, a distance equal to the thickness of the gauge on the magneto spanner supplied with the magneto, also that the points are filed level so as to have a large surface of contact. The timing of the ignition should be checked, as it may have slipped. Driving with retarded ignition is one of the surest ways to make an engine overheat.

Effect of Vibration of Structures.

Recognizing that practically every one is certain that high speed, better work, and greater human efficiency are possible in a stable as compared with a vibrating building, but that exact data proving this fact are difficult to obtain, the Aberthaw Construction Co., of Boston, Mass., is undertaking an exhaustive investigation in the effort to bring together conclusive evidence. They will greatly appreciate any suggestions or reports of experience that our readers may be able to send to them. These may have

Digitized by Google

to do with any aspect of the case that will assist in the collection of facts or the reaching of conclusions.

ASSOCIATED GARAGES.

A Big Convention to Be Held in Chicago the 26th and 27th of This Month.

The second annual convention of the Associated Garages of America is to be held at the Congress Hotel, Chicago, January 26 and 27, 1915, at the time of the Automobile Show there.

E. J. McGuirk, National Organizer, will have full details of the convention in charge. The past year has been devoted mostly to organization work. At the time of the first convention, when the organization was perfected, there were individual members from 18 States present. The only States that had State associations then were Illinois and New York. Since this convention the State of Michigan has been organized and has held two very successful conventions, one on May 22d, at Detroit, at which time they voted to apply for a charter and affiliate with the Associated Garages of America, and one October 7th at Grand Rapids, which showed a large increase in membership and progressing very nicely.

On March 10th, 70 automobile dealers assembled at Des Moines, Iowa, and formed the association known as the Iowa Retail Auto Dealers' Association and, at their convention on August 31, and September 1, 1915, they voted to affiliate with the Associated Garages of America.

The Garage Owners' Association of Illinois, affiliated with the Associated Garages of America in January, 1915. A large delegation in the State of New York assembled at the Continental Hotel in New York City and formed what is known as the United Garage Associations of New York State. At their convention held September 14th, they voted to affiliate with the Associated Garages of America. The Garage Owners' Association of Ohio, have voted to affiliate and apply for a charter from the Associated Garages of America. Early in May, the Garage Owners' Protective Association of San Francisco, one of the strongest local associations in the country, applied for a charter for local membership in the Associated Garages of America.

This association has a large general membership which is composed of individual garage owners throughout the country in cities where there is no local or state association. There exists throughout the country many local associations known as garage and repairmen's associations, dealers' associations, automobile trade associations and supply dealers associations, which come under the jurisdiction of the Associated Garages of America, owing to the fact that they have garage owners for members and, as rapidly as possible, the Associated Garages of America is placing before them the benefits that can be derived by joining.

This association represents the garage industry, the retailing of automobiles, and the retailing of automobile supplies and will be able to work in harmony with the National Association of Automobile Jobbers as well as the Motor and Accessory Manufacturers' Association, with the object of bettering the industry in general and placing it upon a legitimate basis, the same as other old line trades are enjoying.

There are other objects in view and at this Chicago convention committees with strong business men as chairmen, will be elected to discuss ways and means to bring about reform in the business, and it is hoped that the year 1916 will bring about a much stronger and larger association throughout the country and that the prosperity of the automobile business will have been greatly increased and placed upon a higher plane of business principles.

Wherever there is a local association or State association, organized along the lines of the Associated Garages of America, they would do well to correspond with the National Organizer, E. J. McGuirk, 333 S. Dearborn St., Chicago, and find out more about how the work is being carried on and the benefit that can be derived by affiliating with this strong national body which, in its first year, reaches from New York to San Francisco.

CAUSES OF BACKFIRE.

And Some of the Methods to Prevent or Cure the Trouble.

From W., in the Autocar.—Much misunderstanding exists amongst beginners as to what a backfire really is. Some people are afraid of getting a backfire every time they start up, and I want to explain that nowadays backfires are not frequent, and can do little damage. It is well first to explain that the term "backfire" is often applied to (1) firing in the inlet pipe, and (2) explosions in the muffler, as well as (3) to a "back-kick" of the starting handle.

The first is denoted by a popping or banging noise under the bonnet, a fault often described as "backfiring into the carburetor." This erratic performance is generally due to the mixture being too weak. To remedy this the amount of gasoline supplied to the engine must be increased either by cleaning out the carburetor and removing any obstruction in the passages, fitting a larger jet, or, if an extra air valve is used, by closing the air supply slightly. Other less frequent causes are a sticking inlet valve or incandescent spark plug points. Weak mixture, as a rule, is the cause, due more often than not to a partially choked jet or partially blocked feed pipe. This firing in the inlet pipe involves loss of power, and it may be dangerous, as by this means the gasoline in the spraying chamber of the carburetor may possibly catch fire. Therefore the defect should be remedied as soon as convenient. The carburetor is not likely to catch fire as long as the car is running, so that, although something very alarming is suggested, serious trouble is not likely to result in most cases.

Explosions in the muffler are due nearly always to misfiring caused by defective ignition. What happens is that one or more cylinders fail to fire, and the gas therein is discharged unburnt into the muffler and is exploded by the exhaust flame from another cylinder. Here, again, the only damage likely to be done is to the muffler, but the noise is objectionable, and, of course, much power is lost by the misfiring. Generally the trouble is due to a sparking plug being faulty.

A Backfire Proper.

A backfire proper, which is better termed a "back-kick," may occur when the engine is being started, and in the early days was responsible for many a sprained wrist. When motor cars were first produced hot-tube ignition was used, and with this an engine nearly always backfired at starting, and the agility of the operator alone saved him from injury.

Digitized by Google

Then came accumulator ignition, with means for retarding the moment of firing, which was better; but with accumulator ignition it was very easy to obtain a backfire if one forgot to retard the firing point, and this frequently happened. On many modern cars accumulators are still used for starting, and consequently on cars so fitted it is very important to retard the ignition before attempting to start the engine. On the other hand, most carburetors now require the throttle nearly closed for starting, so that there is very little gas in the engine cylinders, and if a back-kick take place it is feeble compared with the hefty backfires which one used to experience with engines which required a wide throttle opening at starting.

With magneto ignition there is very little likelihood of getting a bad back-kick, as the magneto generally delivers very little current unless the starting handle is turned extremely fast, while it is only when it is moved slowly that danger from a back-kick can arise. If the engine be started on the magneto with the throttle nearly closed, it is almost impossible to obtain a serious back-kick, and if one occur it can nearly always be resisted by the operator of the starting handle, as the back-kick is so feeble.

As a precaution, however, to remove any possibility of damage to one's arm or wrist, the handle should always be pulled upwards, and the thumb should be placed beside the fingers under the grip of the starting handle. Consequently, if the engine backfire when the handle is about half-way up, the fingers are merely forced downwards and the handle flies from the hand. If one push the handle down to start and a backfire takes place, the whole blow is taken by the palm of the hand, which is at an angle to the arm; the wrist is then bent backwards and a sprain may occur.

If any beginner still have fear of a back-kick I would recommend him to set the levers right for starting and then spin the engine with the switch in the "off" position. Then he should switch on and give the starting handle a sharp pull upwards. His previous spinning will have filled the cylinders with gas, so that a sharp jerk will be all that is necessary. It helps matters considerably if the left hand rests upon some rigid part of the car, such as the dumb iron, so that one can take up a firm position and be better able to give the starting handle a hefty pull up.

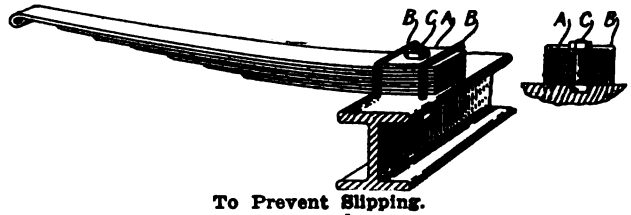
Accidents and Speed.

"One of the greatest merits of the modern automobile," says Mr. Briscoe, "is its capability for sustaining rapid travel, and while it is not to be denied that there are certain dangers inseparable from all fast travel, the dangers are ordinarily much misrepresented and misunderstood.

"As a matter of fact, most automobile accidents occur, in a sense, independent of the speed, and are due more to carelessness and reckless driving than to the actual rate of going.

"Some of the worst accidents occur at the lowest speeds, for which reason legislation of high speed by no means precludes the possibility of accidents.

"It is perfectly demonstrable that fifty miles an hour, with a well-built machine in competent hands, and on a clear and perfect road, may be far less dangerous than six or eight miles an hour with a poor car in the hands of an inexperienced driver in crowded traffic.



"There are circumstances when speed may become a downright factor of safety, since there are times when the least likelihood of accident is plainly to be insured by moving the car quickly from one point to another.

"The most pronounced effect of high speed on the automobile's control is to make steering easy. Yet in this very facility of response lies the greatest danger. Take the case of a car going sixty miles an hour along a straight road twenty feet wide. This means, if the car is of 56-inch tread, and is kept on the crown of the road, it must run seven and one-half feet to one side before it possibly can run into the ditch. This in turn requires that the road wheels be held at an angle of about half an inch out of the straight for the car to go into the ditch in an onward travel of 270 feet.

"This seems, and at low speed is, a great enough distance to guard against the slightest possibility of danger, but if the car is going at sixty miles an hour, or travels eighty-eight feet a second, it follows that a derangement of the steering to the extent of half an inch will put the car into the ditch in about three seconds unless the wrong steering is corrected within that time."

For a Slipping Spring.

Automobile springs have been known to slip on the axle even when the clamps are closely driven. Those on the front axle are most likely to slip. This can be overcome by cutting a piece of spring

To Prevent Slipping.

A, the same width as the automobile spring and just long enough to fit snugly between the clamps B, and fastening it in place with the same bolt C, that passes through the spring. The piece of spring rests against the clamps on either side and prevents the spring from shifting on the axle in case the clamps come loose.

Fitting Small Screws.

Small machine and other types of screws having fine threads, are often very difficult to start into the work, and many times they are dropped into places not easily accessible. There are several methods of preventing this as well as making the work easy. One is to take a piece of annealed wire, bend it double at one end, and slip it under the head of the screw. This will hold the screw steady while the screwdriver is being used. Another method is to cut a V slot in a strip of sheet brass or tin. This has an advantage as it will enable its use with screws of different diameters. Another way is to push the screw through a strip of stiff paper.

When it is not practical to employ these methods, take a piece of wood and cut the end so that it can be forced into the slot of the screw. This will enable one to catch the thread. Magnets are sometimes used where the work permits. Small iron or steel screws can be magnetized by rubbing them on a horseshoe magnet.

WEIGHT REDUCTIONS.

Mr. Duryea Says the Car of the Future Will Be Much Lighter.

From Charles E. Duryea, Dean of Auto Engineers. —When the average man thinks of light weight with reference to his automobile, he of course considers only the total weight of the car and too often snorts, "What matter about the weight? Does not the engine pull it?" Arguments as to efficiency and the various other gains have in days gone by been all too deep for him. He could only appreciate that which he saw, and he could see a big car with its massive parts and imposing bearing. It impressed him with the idea of power and speed. So the massive heavy construction won.

But right never dies. Merit is immortal and sooner or later will bob up after the fallacies have had time to explode and blow away. So light weight is rapidly coming into its own.

That the modern auto will closely follow the history of the horse-drawn carriages and the bicycle and eventually become lightened to a degree even now considered impossible has long been in the minds of many, but that this lightening would be pre-eminent at some of the places where it is now found was not foreseen. And the future undoubtedly holds still further surprises for us.

The first form of lightening the car came in the choice of better materials. The early structural steels, amply good and probably best for their purpose, were far from being the best materials for auto construction. The still scarce metal aluminum was introduced for crankcases in 1895. It was tried for many other services in the next few years by different builders, but not largely used, because at that time suitable alloys and proper foundry handling could not be had. But better steels came, better shop practice became common until the modern auto is a marvel of strength and endurance. And so gradual has this all been that we have not thought of the weight that would have been required had it been possible to use enough of the older materials to secure the modern strength.

Since the last automobile show there has been another long step forward in the matter of light weight. The use of aluminum for pistons marks the success of experiments begun several years before the end of the last century. The light piston permits light connecting rods and light bearings. It permits high speeds and thus a reduction of engine weight. High speeds accompany small cylinders, which in turn mean many cylinders, with the result that the engine needs almost no flywheel, and the strain on the transmission and driving shafts is both light and continuous instead of a series of heavy impulses that require heavy parts to resist.

So the use of aluminum pistons not only saves a small amount of weight in the pistons, but it saves weight every inch of the way to the wheels. This saving permits lighter wheels, lighter frames, and of course lighter springs and lighter tires to carry these lighter loads. It has been stated, and it is doubtless well within the truth, that a pound saved at the flywheel of the engine permits five pounds to be saved in the weight of the car.

Of the money value of this weight saving much should be said. The light car burns less fuel and thus every day pays toward the cost of its lighter weight. But best of all, it is more flexible and responsive, and is more of a pleasure to drive. It starts and stops quicker and is therefore more safe. The light car is the car of the near future.

Cold Weather Starting.

From Chas. L. Haney, Pennsylvania.—I learned quite accidentally how to start motors in cold weather. Instead of priming by filling up or pouring into the priming cups, I use a fine nozzle oil gun and shoot spray and then shoot air into the cups immediately after. Result: Motor goes at the touch of the starter, whereas I had to spin considerable before I discovered this stunt. This may be old to some folks but it is at least new to me, and works like a charm on my Studebaker '16 in the coldest of weather.

Hudson Regains Valvoline Trophy.

The Hudson again holds the famous $1,000 Valvoline Trophy, the most highly prized on the Pacific Coast. The Hudson regained possession of the cup by again lowering the record from Sacramento to Tallac, reducing the record of the best previous time three hours and twenty-six minutes by four minutes. The Hudosn set a new record under somewhat adverse conditions.

NEW AND INTERESTING THINGS IN MOTORDOM

Steer Warms for Winter Driving.

Anyone who has driven a car in the cold weather of winter realizes how much trouble there is from stiffness of the hands which sometimes renders it almost impossible to grasp the steering wheel and more than one accident has undoubtedly happened from this cause.

With Steer Warms which are illustrated herewith you can drive in comfort, even in the zero day. This device consists of two neat leather covered grips, one for each hand which lace on the steering wheel at any place convenient for driving. They operate on the same principle as an electric heating pad. They are simple, efficient and cost very little to maintain. An enormous sale has been made of this article during the present season and jobbers and dealers who have not already stocked up should do so as soon as possible. Another winter device which is highly recommended is the Ieco Electric Manifold Plug, which we also illustrate. This plug puts a hot vaporized mixture into the cylinders causing the engine to start at once. They start the engine on the first or second turn anywhere, and when a heavy starter is used it saves the battery. This plug is inexpensive to maintain, easy to install, simple and compact and guaranteed against burning out within two years. If not as claimed the money will be refunded. The Steer Warms for Ford cars sell for $5.00 and for other makes $7.50; in Canada $7.25 for the Ford car and $11.00 for other cars. The price of the Ieco Electric Manifold Plug is $5.00 in the United States and $7.25 in Canada. Both of these live winter specialties are manufactured by the Interstate Electric Co., 1845 Perdido Street, New Orleans, La.

Imperial Process for Repairing Aluminum.

This is a new system of repairing aluminum, which is so simple that anyone without previous experience can make a permanent repair in a very few minutes. This process does not weaken or warp any part of the crank or transmission case. A heat of only 340 degrees is used. This process is handy, cheap and effective. The complete outfit which only costs $3, is made by the Imperial Specialty Sales Co., 1777 Broadway, New York City.

Big Advertising Campaign for Premier Vulcanizers.

Twelve million people will be reached by the extensive advertising campaign which has been planned for introducing the Premier Automatic Electric Vulcanizer. Among other mediums of large circulation, the manufacturers will use the Saturday Evening Post and Literary Digest. This marvelously simple, yet effective little vulcanizer is made by the Premier Electric Co., 4038 Ravenswood Avenue, Chicago, Ill.

Universal Specialties for Ford Cars.

A very strong line of specialties for the Ford cars is manufactured by the Universal Car Equipment Co., 255 East Jefferson Avenue, Detroit, Mich. This line includes a special touring body, raceabout body, Universal stream line radiator, one-man top and the celebrated Spranger demountable rim wire wheels. Readers are referred for illustrations and particulars in regard to some of these specialties to the full page advertisement from this company which appears in the present issue of our magazine, and for the other specialties not illustrated in this advertisement, direct correspondence with the manufacturers is invited.

Tire-Doh.

This is a preparation for repairing tires and the best evidence of its merit is that for six years it has been used by ever increasing thousands of car owners for making all kinds of repairs in inner tubes and casings. It is now used by over 250,000 car owners, and is sold by 10,000 dealers and 300 jobbers. Tire-Doh is now made in three sizes by the manufacturers, the Atlas Auto Supply Co., 612 West Austin Avenue, Chicago, Ill.

Subscribe to the "Automobile Dealer and Repairer," $1.00 Per Year.

Se-Ment-Ol Radiator Cement.

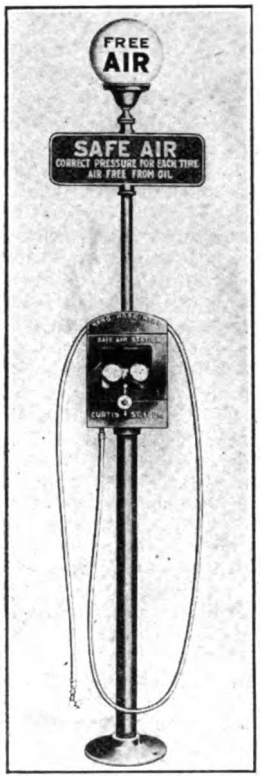
This is a self-acting radiator cement, which works like magic and is simple as A B C to use. It finds a leak and fixes it in fifteen minutes. This preparation dissolves the water and congeals into cement on the edge of the leak. It sells for 75 cents retail for a generous package. The same manufacturers also make a large line of other specialties, including Carbonox, which is described as the chemically correct carbon remover, also the Pioneer Valve Grinding Compound and a list of twenty other live specialties which should interest every dealer. Write for interesting printed matter and full information in regard to these specialties to The Northwestern Chemical Co., Marietta, Ohio.

The Dover Two-Lite Bulb Case for Ford Cars.

This is an entirely new product which has been brought out by the Dover Stamping & Manufacturing Co., of Cambridge, Mass., and the illustration gives our readers a fair idea of its appearance. It is a case 2¼ inches in diameter by 7½ inches long, and it consists of a steel cylindrical tube with a

The Dover Bulb.

removable cover on each end held securely in place by a bayonet locking device. Each cover, when removed, has a socket with spring to securely hold a standard electric headlight bulb. The bulb is inserted in the socket, and the cover put on the end of the tube. This gives the case absolute protection to the bulbs which of course are very delicate and likely to breakage, and the body of the device is that which sells for the extremely low price of 35 cents, enabling the owner of a Ford car to properly care for extra light bulbs in the most convenient manner imaginable.



National Rubber Tirefiller.

This is a substitute for air in automobile tires which is very popular and has had a large sale. This Tirefiller is made of pure rubber, cut in small particles treated, moulded and vulcanized by a special steam process. The object is to do away with the expense of buying, repairing and replacing inner tubes. A small sample will be sent free to anyone interested by the National Rubber Filler Co., 208 College Street, Midlothian, Texas.

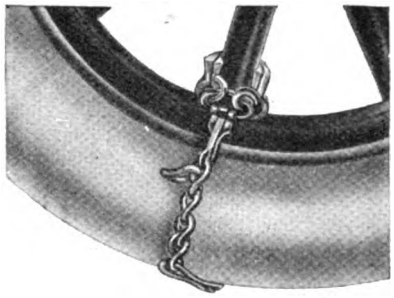
Digitized by Google

Tires Filled Absolutely Correct.

There are more tires ruined due to improper inflation than any other cause. The soft tire rides easy, but wears out quickly and causes loosened fabric, friction between the plies of fabric, blow outs and rim cuts. The average car owner drives up to the free air station, and unless he carries an air gauge with him in most cases the pressure that he will put

in his tire is merely guess-work. Tire manufacturers tell us that much damage is being done by over inflation, especially the last year and a half, due to the fact that garage men are using a higher air line pressure than formerly, in turn due to the fact that they wish to save the time of the automobile owner, claiming that the higher pressure permits the tire user to inflate his tire in less time.

In many cases the man with a 3½ tire will put in the same at pressure that is suited for 4½ or 5-inch tire, and in many cases if his casing is worn, it results in a blow-out which he never thinks to attribute to the pressure, but usually attributes the cause to a faulty tire. Now with the Curtis Correct Pressure Tire Filling Station, the tire user does not have to carry an air gauge around with him, nor does he have to look at the pressure dial at all. He simply turns the handle in front of the station until the pointer inside of the box moves along a dial until it points to the size tire he wishes to fill. He can then get ready and fill his tire, and even if he should hold the tire connected all day, it will be impossible for him to get a greater pressure in his tire than the manufacturer specifies is correct.



This almost indispensable business getter for garages is called the "Correct Pressure Tire Filling Station," and is made by the Curtis Pneumatic Mchy. Co., St. Louis, Mo., to whom letters should be addressed for further information.

Acetylene Gas Generators.

From The Fort Wayne Journal-Gazette—Herman Bohne and Archibald D. Spear, the two employes of the Day-Lite Gas Company, who were blown to pieces when the terrific explosion of an acetylene gas generator wrecked the plant, northwest of the city, near the Bass farm, on December 10, were not informed of the fact that the pressure carried was more than fifteen pounds. They were not aware of the danger which threatened to destroy them at any moment, is the significant finding in the verdict which Coroner Edward H. Kruse has submitted relative to the case. Louis Wagschal, who invented and installed the system of generator that ran the gas pressure beyond all reasonable bounds of safety, is severely arraigned, as the latter was advised, according to the investigation, not to employ so dangerous a system which had been condemned by all reliable authorities on the subject of acetylene gas generation.

Trouble-Proof Tires and Easyon Chains.

Illustrated herewith are two valuable tire specialties, both of which are manufactured by the Leather Tire Goods Co., of Niagara Falls, N. Y. Woodworth Trouble-Proof Tires have a leather strip in them which makes them puncture-proof without making them at all stiff or hard riding. They are guaranteed against punctures or blow-outs for 5,000 miles, and the manufacturers state that on

light machines they generally last from 10,000 to 15,000 miles.. These tires are very carefully made from the very best material obtainable and it is claimed that they will last so much longer than

ordinary tires that they are cheaper in the long run. We also illustrate the Easyon Chains, which are individual chains fastened to the spokes with leather covered fasteners that do not injure the paint. The cross chains are of such design that they cannot cut or wear the rubber. By the use of these chains, instead of wearing out both your tires and chains by using them continuously in wet weather, you can run with bare tires when the weather is good and put the chains on only when they are needed, thus saving a great deal of wear on both tires and chains. For prices and full particulars, write direct to the Leather Tire Goods Co., at Niagara Falls, N. Y., and they will also be pleased to send you printed matter in regard to several other specialties which they manufacture, including fan belts, tire overshoes and spring oiler straps.

A Tire Patch for Ford Cars.

We illustrate the Atco Tire Patch for the special use of Ford Car owners. This patch is made to be used on either 3

or 3½ inch tires. It is made of the best leather to be had. It has a simple locking device which makes it easy for application. It will repair rim cuts as well as blow-outs at any place in the tire. To apply the patch it is only necessary to place around the inner-tube and insert the fasteners through the desired row of slots, and mash the fasteners down with your thumb. This is a neat, tough and durable patch and especially handy for road-side repairs. It sells for only $1.00 and is guaranteed to give perfect satisfaction. This patch is manufactured by the Autocrat Tire Company of Midlothian, Texas.

Giant Non-Skid Tires.

These are high grade tires of standard make which have been rebuilt to extra strength and with a heavy non-skid tread added. The tread and the body of the old tire are vulcanized into one strong unit in live steam, making a tire the same as a new standard make, in quality and appearance, but frequently giving thousands of miles of service. These rebuilt tires are sold at extremely low prices, which will undoubtedly interest a great many of our readers. Dealers can be furnished in quantities at special prices. Made by the Giant Tire & Rubber Co., 101 North Street, Akron, Ohio.

The Stone $10 Shock Absorber.

This is a reliable and effective shock absorber which is placed on the market to retail at the very low price of $10. It is an especially attractive proposition for dealers as it will induce people to buy shock absorbers at this low price who would not feel like paying the ordinary prices. This shock absorber will be advertised extensively throughout the country, and good territory is now open for dealers who will act promptly. For complete particulars write direct to the Universal Rim Co., Department B, 1301 Michigan Avenue, Chicago, Ill.

Electric Starter for Packard Cars.

Throughout the country there are many owners of 1912 and 1913 model Packard cars who are likely to be in the market for a starting device, as at the time these cars were made of course the old cranking system was in vogue. We illustrate herewith an excellent equipment for these cars, which is manufactured by the Wagner Specialty Co., 1902 Broadway, New York City. To those having any mechanical knowledge, the illustration will almost be self-explanatory. The system is light in weight, only 50 pounds with starting motor, not including batteries. The starting motor is but 5 inches in diameter, weighs 23 pounds, and develops 27 foot pounds stalling torque. It is only necessary for the owners of 1913 Packard cars to purchase starting systems, as these model cars are already equipped with lighting generators, which will charge the starting battery, but, on the 1912 Packard cars it is necessary to equip with a charging generator to charge the battery and light the lights. For prices and full particulars in regard to this starting equipment for 1912 and 1913 model Packard cars, write direct to the manufacturers for particulars. They guarantee the efficiency of the outfit.

For 1912-13 Packard Cars.

The Oswego Package and Luggage Carrier.

An interesting accessory for Overland, Buick, Studebaker and Ford cars has just been introduced which will be appreciated particularly by farmers, retail merchants and country store owners. This is a good carrier that slips over the hood and is easily and rigidly fastened to the frame and dash. The device is called the Oswego Carrier and consists of a light, strong steel frame, with two supporting standards that are attached to two brackets simply by tightening four thumb screws. The brackets in turn are quickly fixed to the car without need of drilling or machine work. Access to the engine is not interfered with.

The principal advantage claimed for the Oswego Carrier is that it enables the passenger-carrying car to be used for carrying merchandise or luggage when necessary without blocking the running board or crowding up and littering the tonneau.

It is provided along the front and back top edges with slots for straps; in some designs a detachable wire basket is added which sets into the carrier and provides a convenient package delivery carrier. Price, ready to attach, $6.75 to $10.00, according to styles. Manufactured by the Oswego Machine Works, Oswego, N. Y.

A New Company and New Product.

A new company known as the Motor Appurtenances Corporation has recently been incorporated under the laws of the State of New York, with main offices at Broadway and Fifty-eighth Street, New York City, to promote the sale of automobile accessories both as manufacturers and manufacturers' representatives. They have established a factory at Newark, N. J., where they have started the turn-out of automobile horns. The horn is known as the "Wondertone" and looks to be a winner. It is sold for a moderate price and is guaranteed for life. Its mechanism is of the simplest construction, and by the elimination of gear wheels and wearing parts it appears to be durable. The officers of the new corporation are: Edwin T. Vanderpoel, President, formerly Comptroller of the Otis Elevator Company, George Fritz, Vice President and General Sales Manager, for several years representative of the J. & B. Manufacturing Company, manufacturers of Master Vibrators, etc., and Thomas M. Daly, Secretary and Treasurer. Mr. Daly was in Wall Street for a great many years as a partner of a well-known stock exchange house. The company has placed a number of well-known salesmen on the road covering the major portion of the United States, and also has in contemplation the opening of branch offices in Chicago and Boston. Mr. George Fritz is well known to the trade and doubtless his many friends will be glad to learn of his larger scope of operations.

Solderall.

This is a genuine solder. With a match it easily mends and solders metals permanently. It is very handy for the house-wife, farmer, electrician, automobilist, moving picture operator, jeweler, merchant and mechanic. Good agents are wanted everywhere. It comes packed in a large tube which sells for only 50 cents, and it does not require any special mechanical skill to use it. It is also sold under a money back guarantee. For full particulars, terms to agents, etc., write to the Emenar Co., 52 East 23rd Street, New York City.

Perfection Pedal Pads.

These are well described as a safeguard against accident as they prevent the foot from slipping at a critical time, and enable the driver to get instant action in stopping or starting the car. They are made to fit all makes and models of cars, and they are standard equipment on the Stutz, National, Owens-Magnetic and Lewis cars. Write for prices and full particulars direct to the Auto Pedal Pad Co., Inc., 792 Seventh Avenue, New York City.

The Aitchandee Shock Absorber for Ford Cars.

This is a new device especially made for the Ford car and backed by a tremendous advertising campaign. Although new on the market, this shock absorber has been thoroughly tried out for a year all over the country. It will be advertised in a national way through such well known publications as the Saturday Evening Post, Collier's, the leading automobile publications and a list of farm papers, and large space will be used in all these mediums. This shock absorber is made on the true cantilever principle, and it has the long sought different tension between the upward and the downward thrust. It is claimed that this shock absorber absolutely prevents the breakage of springs, because of special added resiliency. The device is practically invisible and does not mar the appearance of the car. It is easy to attach, with no holes to bore, and everything is furnished for the complete job. Good agents are wanted for this device throughout the country, and it certainly ought to be a quick seller, especially as the retail price has been placed at only $10. Dealers who would like to handle the Aitchandee Shock Absorber are urged to write for interesting printed matter and full particulars direct to the H. & D. Company, 46 Marion Street, Goodland, Indiana. Remember this shock absorber is guaranteed for the life of the car, and it is practically indestructible.

Cristalene for Windshields.

This is an effective preparation for keeping the windshield clear so that accidents may be prevented. All drivers know the great disadvantage of obscured windshields, but if this preparation is applied to the windshield its transparency is fully maintained in all kinds of weather, as snow, rain or steam cannot accumulate on the surface which has been trated. The 25c size of this preparation is ample for fifty applications, and dealers are furnished with attractive display cards, and they are also given such a discount that this will be found a very profitable line. Dealers, car owners and all others who may be interested are urged to write for prices and full particulars to the Utility Manufacturing Co., 601-605 E. Court Avenue, Des Moines, Iowa.

Patent for Vulcanizer Issued.

Letters patent of the United States has been issued to Wallace G. Sandford of Davenport, Iowa, on a portable steam tire vulcanizer. Mr. Sandford is assignor of this patent to the Positive Supply Co., manufacturers of Positive Steam Vulcanizers. This company, however, has recently consolidated with the Midland Supply Co., of Davenport, Iowa, and the business is now being conducted under the latter name.

The Ideal Lawn Mower Grinder.

This machine is a thoroughly practical one, and many of our readers can make considerable extra money by installing one of these machines and grinding lawn mowers for the same customers who come to have their automobiles repaired. This machine will grind any make of lawn mower perfectly in fifteen minutes without removing the wheels, ratchets or reel-knife. It will also grind a straight knife without removing from mower. The machine is operated by either hand or power. It has a skate sharpener attachment for sharpening skates. Here is a great labor saver and money maker for your shop. Write today for prices and full particulars direct to the Root-Heath Mfg. Co., Plymouth, O.

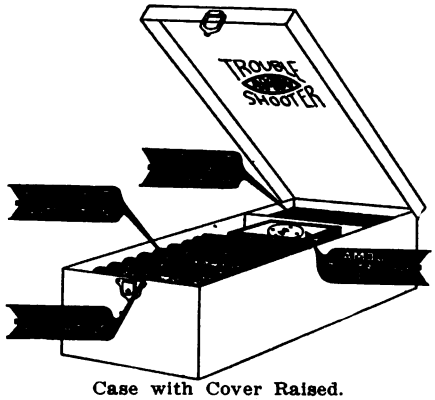
Adamson Vulcanizers.

This is a very simple device by which the car owner can make his own tire repairs, either on the road or in the garage. No watching or regulating is required in using this vulcanizer. Common gasoline is used for fuel, and the vulcanizer is practically automatic. It will make a tire repair instantly, right on the spot wherever you are, at a cost of a few cents only for each repair. Write for interesting free booklet, "Repair and Care of Tires," to the Adamson Manufacturing Co., East Palestine, Ohio.

Change of Ownership.

The Reliance Engine Company of Lansing, Mich., have purchased the Seager Engine Works of Lansing, manufacturers of the well known "Olds" line of gas and kerosene engines which have been extensively used for light power in blacksmith shops and also by farmers for many years. We understand that the new company intends to manufacture engines on a larger scale than ever and many of our readers will doubtless be interested.

Motor-Driven and Hand Horns.



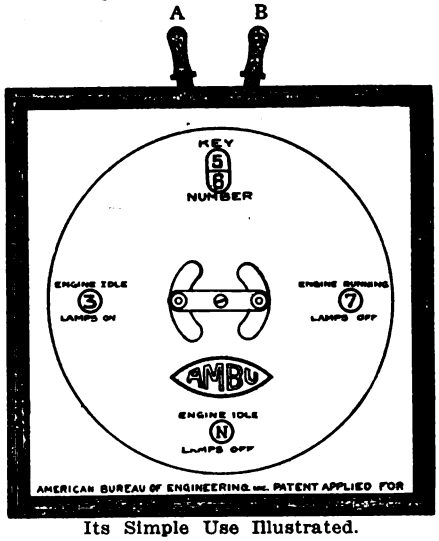
A very attractive line of motor-driven ınd hand warning signals for motorists s manufactured by the American Elecric Co., State and 64th Streets, Chicago, ll. This line includes the Samson-Lion ıutomobile hand horn which is a push-lown horn; length 9¾" over all; attracively finished in black with nickel trim; ist price complete, $4.50. The same ompany also manufactures the Victor 'ibrator horn, which sells for $4, and the amson Jr. Motor-driven horn, a very igh grade warning signal which sells or only $10. Interested readers should rite direct to the manuafcturers for an lustrated catalog showing their comlete line.

U. S. Two-Stage Air Compressors.

These are excellent air compressors or use in garages and they are made in ifferent sizes suitable for the large or nall shop. They will start quickly with-ıt strain. They run smoothly and ıietly, and the load is divided between igh and low pressure cylinders. It is ated that there is practically no wear-ıt or repair expense on these machines, ıd they are put out on thirty days trial, ıd unlimited guarantee, also terms to ıit your convenience. For prices and ıll particulars write to the United ates Air Compressor Co., 6534 Car-egie Avenue, Cleveland, Ohio.

The Story of Ambu.

A new department of labor which has been put upon the garage and repair man is that which has to do with adjusting and repairing of electric starting and lighting systems. The American Bureau of Engineering has put upon the market a system which enables the repair and garage man to definitely locate and correct any trouble in any electrical or starting system standard on American made cars. The instrument called



Case with Cover Raised.

Ambu, which is used to locate and detect the source or position of the trouble, is round, measuring 6 inches in diameter. In its construction, finish, and general appearance it reflects the ability to do the work claimed for it.

As the heart of any system is the storage battery, the instrument is attached for reading between the battery and battery cable. A remarkable part of its performance is that it may be calibrated or keyed to the particular make of car or system under test. Figures show up on the dial to which the arrow points and a reference to the instruction books, charts and diagrams of wiring, will give the necessary information for the correction of the trouble.

Every phase of every system is cov-

Its Simple Use Illustrated.

ered in the instruction books. Each diagram shows the system of wiring, the location of switches, dynamos, motors, starters, lamps, battery, etc., in their relative positions as installed on the particular make of car treated.

Ambu, the Electric Trouble Shooter, fills a long felt want in many ways. It relieves the motorist of the expense of sending parts to service stations or factory because his local garage man can handle it for him if he has Ambu. It relieves the factory or service station of the necessity of being bothered by time consuming jobs which don't pay but must be done if the stuff is sent into the factory. It saves the motorist extra expense involved in shipping, it saves time and it most surely lowers the overhead of the manufacturer because of the lack of a necessity of so great a force to care for somewhat insignificant repairs. The instrument has astonished even seasoned experts. It is claimed by the makers of Ambu that the instrument and the complete Ambu service will place the average garage and repair man in a position to handle the most intricate jobs of repair and adjustment work in the starting and lighting systems standard in American cars.

Ambu service consists of Ambu, the instrument, Ambu instruction books, Ambu wiring diagrams, Ambu repair charts, Ambu service bulletins, and Ambu engineering advice.

The entire service is contained in a steel box with book—dust-proof and secure, and the garage or repair or service station possessing this remarkable system is identified by a service sign—an enameled steel sign of a noticeable design—furnished free by the American Bureau of Engineering. This is to be extensively advertised to fix in Motor Car owners' minds the proper places to obtain an efficient and authoritative service both on the electric system as well as on other parts of the car.

A Special Reamer for Ford Cylinders.

Many garage owners and repairmen will be interested in the special Critchley Expanding Reamer for Ford and Dodge cars which is manufactured by Chadwick & Trefethen, 32 Bow Street, Portsmouth, N. H. This is a shell reamer with taper slots and fitted with eight semi-speed steel cutters. To make the reamer cut larger, it is only necessary to loosen the top nut and screw on the lower one, making a practically perfect adjustment. For particulars and prices, write direct to the manufacturers.

Service Stations.

It is remarkable how the demand for tire service stations has grown and developed during the past few years. Motorists not only appreciate, but look for this kind of service, and the Miller Rubber Company was quick to appreciate it and supply the quick and handy repair facilities now being enjoyed by car owners in most cities. There is a Miller Service Station in most of the numerous cities in which the company has dealers or branches. More are being established from time to time. Location in a town is a cardinal point in the estimation of the Miller Rubber Company. Practically all of their Service Stations are located with the one big thought foremost in mind—quick service! And quick service is given, as any of the thousands of motorists who have put it to the test will enthusiastically testify. The best part of it all is the fact that the Miller Rubber Company offers this remarkably quick, courteous and efficient service absolutely free of charge at any hour of the day or night, to any motorist, whether he is using Miller Tires or not.

Invincible Inner Tires.

It is contended by many that the proper place for strengthening the tire is on the inside where the blow-outs always start, and Invincible inner tires are manufactured with this principle in view. By their reserved strength, these inner tires render tire trouble almost impossible. It is claimed that they save 40 per cent of tire expense, and 90 per cent of tire trouble, and tires which have run three or four thousand miles can sometimes be made to do as much more by the use of these inner tires. For full particulars write to the Invincible Tire Company, 53 Sabin Street, Providence, R. I.

Superior Radiators and Hoods for Ford Cars.

An unusually complete line of special radiators and hoods for the Ford car is manufactured by the Superior Lamp Mfg. Co., 136 West 52nd Street, New York City. The same company also manufactures lamps, crown fenders, commercial fenders, demountable wheels, convertible lamp brackets, cowl windshields, ventilator windshields, zig-zag windshields, and an almost endless variety of specialties for the Ford and other cars.

The Hart-Bell Carbon Remover.

This is a device for introducing live steam into the cylinders of the motor. Carbon cannot be dissolved; it can only be loosened, and live steam is the best agency for this loosening process. The carbon is then blown out through the exhaust while the motor is running. This carbon remover is permanently attached (you can attach it yourself) and can be used as often as desired. It is guaranteed that this device will do all that is claimed for it, and if found unsatisfactory, the full purchase price will be refunded on return of same within ten days to the agent from whom it was purchased, or from the manufacturers if purchased direct. This carbon remover retails complete for only $5. Made by the Utility Products Co., 1414 Times Building, New York City.

R & M Conform Piston Ring.

These rings are not only provided with sealed joints, but they have the power of conforming to irregular and worn cylinders. They are the most effective when used with the R & M Alluminum Alloy pistons and the manufacturers will furnish four R & M Aluminum Alloy Piston Rings for only $30. These rings, however, are suitable and most economical for all kinds of pistons, such as are used in automobiles, marine engines, steam packings, oil pumps, and all air appliances where rings are used. Write for prices and full particulars direct to the distributors, The Superior Auto Parts Co., 938 Ft. Wayne Ave., Indianapolis, Ind.

The Wilmo One-Piece Combination Manifold.

This is a device for increasing the power of an automobile motor, eliminating carbon troubles, and otherwise improving the working of the motor. The manufacturers state that with this device in operation your motor will run as smoothly in winter as in summer. A drop of gasoline on a hot griddle vaporizes immediately, and in the same way the hot plate which is an important part of this invention causes prompt and complete vaporization with the delivery of the fullest amount of power into the cylinders of the motor. This device is made for all cars, and the special manifold for Ford cars sells for $5.00; for other cars the price is $10.00. The invention is guaranteed to wear and give satisfaction for ten years. For prices and full particulars write direct to the manufacturers, the Wilmo Company, 209 South Fifth Avenue, Chicago, Ill.

Calorite Spark Plugs.

The discovery of a new insulating material known as Calorite and its adoption by the Hartford Machine Screw Company, manufacturers of Master Spark Plugs, has revolutionized the spark plug industry. In Master Calorite Spark Plugs, automobile owners are assured of a spark plug that will not break under the most extreme heat and cold

Calorite Spark Plugs.

conditions. The new Calorite insulator for Master Spark Plugs was adopted only after being subjected to the most terrific tests. The plug was first heated until white hot, then plunged into cold running water, a test so severe that it has never before been attempted. This great instant change in temperature had no effect on the Calorite Insulator nor were there any signs of fracture when this alternate heating and cooling was repeated 10 times. A break down test was also conducted which consisted of heating the Calorite Spark Plug to a bright red heat and instantly plunging it into cold running water. This alternate heating and instant cooling was repeated 26 times without fracture. The ordinary porcelain insulator was put to the same test but broke before reaching a white heat and without being put into the water at all.

With the creation of 8 and 12 cylinder engines—refinements and perfection of design and manufacture—spark plugs must suffer more abuse than ever before. This fact could not be better illustrated than by citing last summer's automobile races in which spark plug failures put a big percentage of cars out of the running. The terrific heating caused porcelain plug insulators to crack with the resulting sacrifice in time and loss of drivers' and automobile manufacturers' prestige.

The old days of broken spark plug insulators are over. Master Calorite Spark Plugs are proof against fracture in service—they won't break when subjected to extreme heat and cold (as proved by the tests just described) and the whole design assures complete freedom from trouble.

Three Live Specialties.

The Manufacturers Distributing Company of America, 246 West 56th Street, New York, is putting on the market quite a number of desirable specialties for motorists. One of these is the Nite-Lite, a search lamp which can be turned at any angle to search out danger and read signs along the road. Something of this kind is almost an absolute necessity for night driving, and ought to appeal to a great many of our readers. The same company is marketing the Detroit limousine top for Ford cars, which is a luxurious winter top at a low price; also the V Hot Air Valve, which is a device attached to the intake manifold just above the carburetor, so it will admit superheated air into the gas as it passes from the carburetor to the cylinders, preventing all carburetor troubles. It is claimed this device will save one gallon of gasoline out of every four, at the same time increasing the power of your car. Readers who are interested in any of these specialties should write direct to the manufacturers at the above address.

Lightning Repair Sets for Ford Cars.

A complete assortment of taps, dies and reamers has been selected by the Greenfield Tap and Die Corporation, Wiley & Russell Mfg. Co. Division, of Greenfield, Mass., to meet the demands from garages and repair shops for spe- The tools are of the celebrated Light- cial use in handling repairs on Ford cars. ning quality which have been in the front rank for nearly 45 years. This set sells at retail for $14.50, and it is very dependable and complete for the purpose designed. Write for full particulars direct to the manufacturers.

Finding a Treasure.

The manufacturers of the Waterhouse Oxy-Acetylene Welding Equipment state that it is like finding a treasure for any blacksmith who will purchase one of these outfits, and this is no exaggeration, because if you get this outfit and commence to do repair work in your part of the country, you can soon make a large income from this source alone, in addition to the regular work in your shop. This is not an expensive outfit, although it is reliable and complete, because the total price is only $42 with 5 per cent discount for cash. If welding materials are desired to go with the outfit, there is an additional expense of $4.50 which is also subject to the 5 per cent discount. This is not a great deal of money when you consider that it will practically set you up in a new line of busines. Write for full particulars direct to the manufacturers, the Waterhouse Welding Co., 16 Pelham St. Boston, Mass.

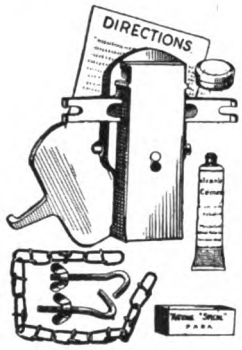
jack, manufactured by the same company, called the Red Rack Jack. We regret the mistake made, and the Red Rack will be described in a later issue of this magazine.

Private Portable Garages.

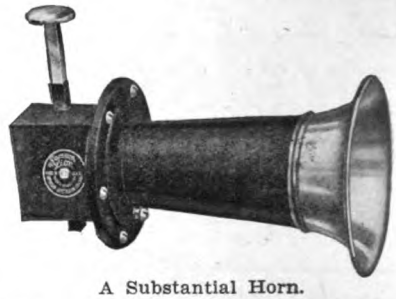
Many car owners can avoid rent charges by erecting on their own premises a good portable garage, which it is



A Fine Garage.

claimed, can be obtained at a much lower price than it would be possible to build with the aid of local contractors. We illustrate a neat pattern of garage which is manufactured by the Garage Factory, Beaver Springs, Pa., and they have brought out a new illustrated catalogue describing a complete line of low-priced garages. We understand that this will be mailed free to any of our readers who will take the trouble to write for it.

Sure-Cure Automatic Steam Vulcanizer.

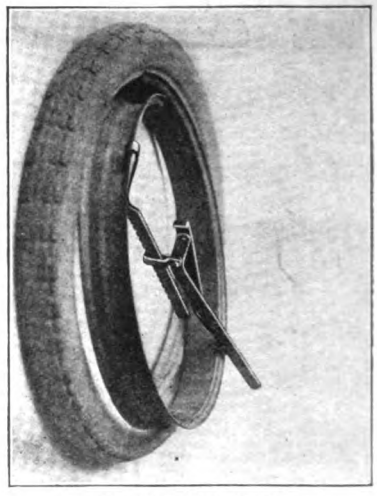


The Sure-Cure Vulcanizer is the latest product of the oldest and largest manufacturer of portable steam vulcanizers in the United States. It represents the last word in vulcanizers for the car owner to use at home or on the road. The "Sure-Cure" is a metal body partly filled with water at the factory and never needs refilling. Heated by gasoline, forming the water into steam. Steam thoroughly cures raw rubber with no danger of burning it. Anyone without experience can easily do perfect vulcanizing the first trial, as this vulcanizer is so simple in operation. It is especially fine for tourists, as it is practically cyclone proof, burning evenly in the strongest wind. Requires no watch-

ing after lighting. Does its work quickly, and you can always rely on a "sure-cure" every time. Double the life of your casings by keeping those small cuts repaired. Vulcanize the punctures and blowouts in tubes, and they are as good as new. This vulcanizer will pay for itself many times over during a season. Satisfaction absolutely guaranteed by makers or money refunded. Nicely nickel plated and packed in neat box with slide cover with all supplies and instructions. Shipping weight, 4 lbs. Price, $2.25. For further information and description, write the manufacturers, The National Motor Supply Co., 5611 Euclid Avenue, Cleveland, O.

The Samson-Lion 1916 Hand Horn.

Safety of life and property depends upon the selection of a horn, which will give a loud and penetrating tone that will clear the road, and which is easy to operate. The purchaser must select a horn which will not break down at a critical moment, but will give ample and substantial service for the money invested, and last indefinitely. In this respect the Samson-Lion horn is common with the rest of the Samson Horn line. A guarantee covers this horn absolutely in that the manufacturer will replace or repair without charge any portion which develops a mechanical defect within a period of one year from the date of manufacture, the manufacturer being exceedingly liberal in the interpretation of this guarantee. The more gears used in a horn, the greater the friction and the more bearings required. Some horns have as many as four gears to catch, break or wear out. Only one shaft is used in this 1916 horn—the Samson-Lion. The pinion and strike wheel are cut from solid pieces of special, high-grade steel, afterwards case-hardened, and every tooth on the strike wheel is ground to a clean edge, so it will absolutely produce a uniform tone. There are no soldered joints for constant vibration to work loose, but all such parts are riveted and bolted to last. The pressed steel rectangular back is small and neat; it does not protrude in way



A Substantial Horn.

of driver. It is just as easy to operate the Samson-Lion as any electric or hand horn made. By holding down the plunger a prolonged warning is obtained, but the second it is released all unnecessary noise is stopped. It is the one dependable warning signal and will outlast the life of the car. Length, 9¾ inches over all. Attractively finished in all black and black with brass or nickel trim. Manufactured by American Electric Company, State and 64th Streets, Chicago, makers of a complete line of automobile and motorcycle horns.

The L. & L. Handy Tire Tool.

This is a very handy tool, which can be used on all sizes of split demountable rims, either clincher or straight side. It is guaranteed to remove or replace casings in less than one minute. The illus-

Handy Tire Tool.

tration shows quite clearly how this tool is used. It is made by John C. Hoof & Co., 38 South Dearborn Street, Chicago, and it retails for only $2.

The General Tire and Rubber Co.

This company, successor of the Western Tire & Rubber Co., Kansas City, Mo., has a very large factory plant at Akron, Ohio, which is located on an elevated twelve-acre plot of ground on the outskirts of the city. The capacity of the plant is 400 tires and 1,000 tubes per day and an output of tire accessories double that of the old Western Tire & Rubber Co.

To Winterize Ford Cars.

The Anchor Buggy Company of Cincinnati offer the Anchor sedan top for the Ford touring car and Anchor coupe top for the roadster. These tops can be quickly attached to the regular body by anyone. They are the result of months of development. The roof, back and

Anchor Coupe Top for Ford Roadsters.

panels are wood, covered with high grade upholstering material. All windows are glass, even the round pane in the back. Inside is neatly trimmed with attractive light colored whipcord. Doors of the top and car-doors open together, operated by a single patented locking device. These closed bodies convert a Ford car into a comfortable limousine, making it possible to use the car all year around with comfort. Windows can be let down for ventilation in moderate weather. In pleasant warm weather, doors and side

Anchor Sedan Top for Ford Touring Cars.

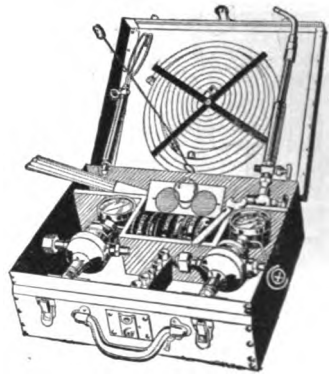
windows may be removed and regular curtains used. These tops combine light weight, strong construction, attractive lines and excellent finish. Their low price is made possible by large production. Complete for touring car, $57.50. Complete for roadster, $47.50.

Refilling Prest-O-Lite Tanks.

J. T. Wall and Harry T. Ream, of Sacramento, Cal., have filed suit against The Sun-Lite Co., of Indianapolis, and O. K. Stuart, its president, charging fraud in the sale of apparatus to be used for the purpose of filling Prest-O-Lite tanks. Wall and Ream set forth that they purchased the apparatus from Stuart in March, 1915, and that Stuart represented that the device would refill 30 Prest-O-Lite tanks of 40-foot capacity at the cost of a few cents each. They claim that Stuart grossly misrepresented this filling cost, and also that the filling of tanks, instead of being the whole cost, was only one item in the cost of conducting an acetylene exchange business. The complainants charge that Stuart represented the business of "refilling" Prest-O-Lite tanks as being a lawful one, whereas after purchasing they found that the practice has been enjoined by a large number of United States Courts and that they could lawfully operate only by removing the Prest-O-Lite marks from the tanks and converting it into a Sunlite tank which was then not acceptable by Prest-O-Lite dealers for exchange when empty. They also charge that the device sold them by Stuart for the generation of acetylene gas at high pressure was extremely dangerous and that the Stuart's own plant at Indianapolis was destroyed by fire resulting from an explosion of one of these machines, and it was then abandoned and never rebuilt. The Sun-Lite Co., of Indianapolis, is engaged in the manufacture of acetylene generating outfits, for the refilling of gas tanks.

The Watchdog of a Motor's Power.

The above is the very effective slogan which has been adopted by the Micro Piston Ring Co., 1960 Broadway, New York City, and we illustrate herewith the clever trade mark of this company with the accompanying slogan. This trade mark will be extensively used for adver-



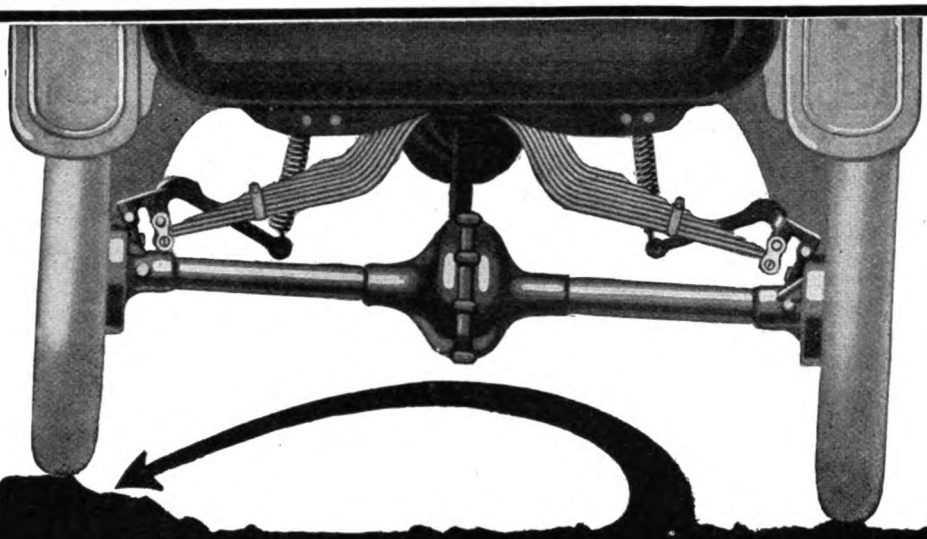
tising purposes all over the country, not only in the trade journals but also on the sign boards, and dealers will be helped materially by this extensive campaign. We also illustrate the Micro piston ring itself, and of course it is the mechanical construction of this ring which has made it so very successful. This ring consists of two assembled members; a main ring with inter-fitting stepped joint and a plain-jointed auxiliary ring. In expanding, the two-ring parts act with the flexibility of the leaves of a spring to assure good contact and the absorption of a minimized

amount of power in frictional drag and wear. Obviously this design conforms well to a perfect cylinder and is most apt to hold on a badly worn cylinder. One great point in favor of this ring is that there can be no break in the continuity of the bearing surface and the pressure tightness of the ring as a whole, either when the ring is new or after the joint openings have enlarged from service. Thus perfect tightness is secured without using any pins or other devices of a shape to score the cylinder walls. Users of the Micro Piston Rings are enthusiastic in their praise, and it is claimed that they will increase the power of the motor, prevent carbonization, and give a greater degree of efficiency and durability under all conditions. The strongest inducements are made to good dealers on these rings, and during the season of 1916 they will be pushed harder than ever, as the manufacturers are planning to do business on a much larger scale. Write for prices, terms and full particulars direct to the Micro Piston Ring Co., 1960 Broadway, New York City.

A Welding Outfit for $50.

We illustrate herewith the New Model B Welder which retails for $50

New Model B Welder.



and which has been recently brought out by the Cox Brass Mfg. Co., of Albany, N. Y. This is a very complete welding and decarbonizing outfit backed by the strongest possible guarantee. It is only necessary for the user to connect the outfit to the gas tank and he will be in a position with the material and apparatus supplied to handle any average job of repair work which may come to him in the line of oxy-acetylene welding. The cut will give an excellent idea of the appearance of this outfit.

The Wagner Auto Engine Cleaner.

Nearly every motorist realizes the value of a clean engine and the Wagner Auto Engine Cleaner is an excellent device for cleaning your motor. This invention will soon pay for itself, as it eliminates wear, saving half your repair bills. One quart of kerosene and six pounds air pressure removes all dirt, grit and grease from any engine. This tool is quick, economical, thorough, easy, and cleanly to operate. Write to-day for price and full particulars to the Wagner Specialty Co., 18-20 West 63rd Street, New York City.

See How The Body of the CAR Remains Level!

Greater Profit for Dealers

Now comes a real shock absorber for Fords, backed by a tremendous advertising campaign. It is new in a way, yet it has been tried out for a year all over the country. It is new in name and new in improvements and new in its sales plan.

Maybe you have heard of it in its test form—when we called it the H. & D. Now it has been christened Aitchandee Shock Absorber. It is about to be nationally introduced to the Ford owners of America through such publications as The Saturday Evening Post, Collier's, all the automobile papers and the chief farm papers. Not in small space, but in large space.

The bettered product retains all the successful essentials which have made it universally praised by owners. All that has been done is to add a few improvements—a few refinements.

Aitchandee Shock Absorbers
For Fords—$10.00

There are numerous reasons why Aitchandee Shock Absorbers will take first place. All cannot be given here, but some of them are:

1. **Aitchandee is the original shock absorber with the true cantilever principle.**
2. **Aitchandee is the only one that has the long-sought different tension between the upward and downward thrust.**
3. **Aitchandee absolutely prevents breakage of springs, because of special added resiliency.**
4. **Aitchandee is the only one that is practically invisible. It does not mar the appearance of a car.**
5. **Aitchandee is easy to attach. No holes to bore. Everything is furnished for the complete job.**

These are bare summaries of a few features. We might go further and explain each statement. For instance, our cantilever principle *removes* those "side slaps" and thrusts which make steering hard over rough roads or at a high speed; being made of specially annealed malleable iron, breakage is eliminated. There are endless advantages such as these.

Every good business man knows that the wisest strategy in the game of business is pushing the winners. To be known as "the man who sells Aitchandee Shock Absorbers" will mean a lot to you. It will affect the other departments of your business. Aitchandee is bound to be coveted by progressive dealers.

But what you are more interested in is the amount of profit you will make and the satisfaction you will give your customers. We have a plan that you will like. We go further in giving you advantageous terms. Our shock absorbers have been retailing at $15. Now, because of such increased volume, we have cut the price to $10. Yet your profits have been increased.

We back you up on the merits of the Aitchandee Shock Absorber by guaranteeing it for the life of the car. This, we believe, is the best sort of guarantee, and that it will please your customers.

You are interested, too, in all that we will do in creating a desire among Ford owners for Aitchandee Shock Absorbers. You will want to look over our advertising campaign. Then send for our circular, which gives detailed particulars. Once you read it, you will become enthusiastic, and see just how Aitchandee will triumph.

This circular will tell you all about your profits, and it will make a special offer to you which will astound. You will learn just how far we have planned to go in helping the dealers. Write today—don't delay.

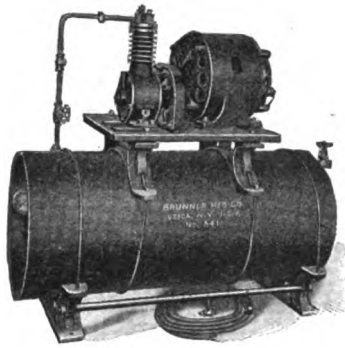
A Motor Restaurant and Fireless Cooker.

We illustrate herewith two very clever devices for motorists, which have recently been brought out by the Ajax Trunk and Sample Case Co., 91 Mercer Street, New York City. The Motor Restaurant, so-called, closes up in the

shape of a suit-case. When opened up it acts as a table. It has space for two pint and two-quart vacuum bottles, two very large sandwich boxes, white enamel cups and plates, knives, forks, spoons, etc., with a service for six persons. This outfit retails for only $35, and it is certainly a boon to the tourist who does not want to depend on the bad hotels or boarding-houses which are frequently found in the country, and this restaurant renders it possible to dine in picnic fashion by the side of the road in the woods or at any convenient place. As to the fireless cooker, it fills a long-felt want for motoring. This cooker is practically the same as the Duplex Fireless Cooker, which is no doubt familiar to many of our readers. The Cooker has a space for two quart vacuum bot-



tles and a spacious tin box for sandwiches, etc. With it, goes an outfit of enamel cups, plates, knives, forks, spoons, with a service for six persons. This outfit retails for $40.

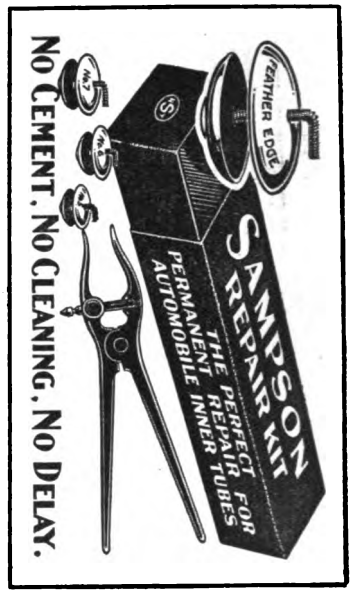
Ball Bearings and Their Commercial Application.

This is the title of a book which has recently been brought out by the New Departure Manufacturing Co., of Bristol, Conn., and it will be found very useful by any manufacturer of automobiles, or any proprietor of a garage or repair shop. Though the book is published by the New Departure Manufacturing Co., and the opening and closing chapters have to do with their special make of ball bearings, it is true that the bulk of the book is a discussion of applications of ball bearings to various forms and types of modern mechanism without specific or definite reference to New Departure Products and it is a strictly educational book containing information which is etxremely useful for every-day mechanical practice. We understand that a copy of this book will be sent entirely free to our readers if they will take the trouble to ask for it.

Motor Driven Air Compressors.

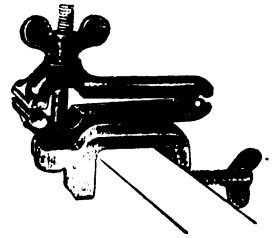
The Brunner Manufacturing Company, of Utica, is exhibiting at the National Shows what they claim to be the largest and most complete line of belt and motor driven air compressors manufactured for tire service and among these outfits will be found their No. 541 motor driven assembled unit, as illustrated. This outfit consists of a standard No. 101 Brunner vertical air compressor, geared by means of a cloth pinion and cut cast iron spur gear to a ½ horsepower motor, securely bolted to a substantial iron base and mounted on a 32-gallon, welded, open-hearth flange steel tank, tested to 300 lbs. air pressure to the square inch. The tank when charged to 160 lbs. and without the motor operating will fully inflate four flat 35 by

The Brunner Compressor.



4½-inch tires to 90 lbs. pressure and will harden up 20 to 25 soft tires according to size. This makes a most complete and convenient outfit for tire filling purposes where the available space is limited or in case the purchaser does not wish to go to the trouble of installing an outfit. The compressor has a capacity of 1¼ cubic feet per minute at 350 R. P. M. The Brunner Manufacturing Company are also putting out a No. 542 outfit, which is identically the same as the No. 541, except that it has a two-cylinder compressor of just double the capacity of the air compressor supplied on the No. 541 outfit. The No. 541 is recommended for garages housing up to 35 cars and the No. 542 for garages housing up to 50 cars.

Marvel Mist.



This is a product prepared by one of the leading chemists affiliated with the automobile body cleansing and polishing industry. Marvel Mist is non-inflammable, non-combustible and contains no alkali to injure the varnished surface. It is used effectively for cleaning and polishing automobile bodies, fenders, hoods, wind-shields, leather upholstery and also for furniture, floors, marble, tile and in fact any surface with a polished or varnished finish. This preparation comes in a retainer, packed in a box with cheese-cloth, ready for instant use. Fifteen minutes is all that is required to clean a large touring car. You simply spray on the liquid and wipe dry with the cheese-cloth to obtain a gloss that will rival factory finish. Those who have used this preparation in the garage would not be without it for anything. Marvel Mist is made by the Marvel Mist Manufacturing Co., Inc., 56 Greenpoint Avenue, Brooklyn, N. Y.

Stevens Exhibit at New York Show.

The exhibit of Stevens & Co., 375 Broadway, New York City, at the New York Automobile Show, attracted much

attention. This exhibit included the Sampson Featheredge Inner Tube Repair Kit selling at 50 cents. See illustration. Also a complete line of service reamers for Ford cars, including a new crank shaft aligning reamer for main bearings, which is listed at $10.00. A hand-vise, illustrated herewith, was also

The Stevens Clamp.

shown which sells for $1 complete. The clamp sells for 25 cents, and will fit any Stevens Hand Vise.

Perfection Pedal Pads.

Among these pads is one designed for the Pierce-Arrow, another for the Cadillac, and still another for the Ford car. The Ford Pedal Pad was patented in December, 1915. These pads are a safeguard against accident as they prevent the foot from slipping at a critical time and give instant action when it is necessary to get the car out of a bad place. The manufacturers make pads to fit all makes and models of cars, and this article is standard equipment on the Stutz, National, Owens-Magnetic, and Lewis cars. Readers who are interested should send for prices and full particulars direct to the manufacturers, The Auto Pedal Pad Co. Inc., 792 Seventh Ave., New York City.

Stoddard-Dayton Parts.

A complete stock of parts for the Stoddard-Dayton car is carried by the Dayton Auto Repair Co., 353 West 52d Street, New York City.

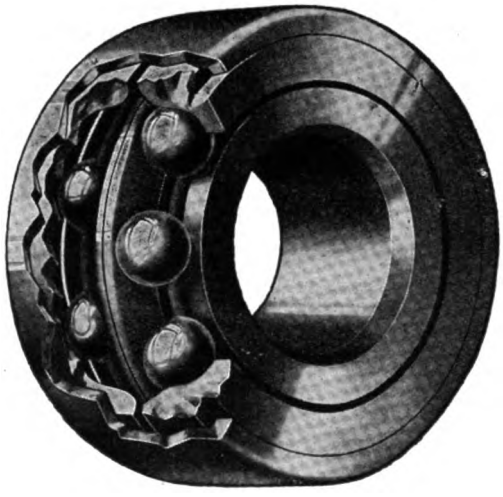
There Are Times When You Are Called Upon to Supply a Bearing—Quick—Then What!



NEW DEPARTURE BALL BEARINGS

American Made for American Trade

Are the Bearings you should carry to meet this demand for—two reasons

Quality is first. Satisfy yourself that the bearing you use is well designed, well made and will stand up to its work.

New Departures meet every quality requirement, will outlive the life of the car in which they are used and reduce the cost of upkeep.

Service—No matter how good a bearing may be, it is of no use unless you supply it promptly.

New Departures may be had from our factory, from our Detroit Branch, in all trade centers—or—better yet, carry a few of the leading sizes in stock yourself.

New Departure Ball Bearings are Guaranteed and we stand back of our guarantee without a quibble

MERIDEN, CONN.

Starting the Car With a Dishrag.

If your car balks and does not start one of these frosty Fall mornings, go into the kitchen, appropriate your wife's dishcloth and her kettle of hot water, wrap the dishcloth around the carburetor manifold or intake, pour on the hot water, spin your flywheel a few times and you probably will have the engine humming.

This was the advice given to an inquirer by H. C. Brokaw, principal of the automobile school of the West Side Y. M. C. A., 318 West Fifty-seventh street, New York. It was the inquirer's first season with a car, or he might not have asked, and because there are thousands like him Mr. Brokaw passes on the advice for their benefit. "There are other things which may be the cause of trouble," he said, "but that is the first thing to try. The cold affects the vaporization of the gas, the moisture in the air may condense and precipitate directly after the vaporization and make trouble. Heat remedies this quickly. Cold weather knocks the efficiency of the storage battery, also, and it will not give off as hot a spark. This, with the partially vaporized mixture is very vexing. When the short days come more light is used and the battery runs out quicker, and a low voltage will make trouble. The larger use of the starter necessary on cold days is another drain on the battery which must be taken into consideration. The two things to remember when the car does not start on a cold morning are: Either the mixture is not vaporizing, or the ignition is faulty. Sometimes enriching the mixture will remedy the former. Modern cars have a device for that purpose. If that fails, try the dishrag."

201 Pounds of Parts by Parcel Post.

The largest package of motor parts that has ever been sent to a foreign country via parcel post, so far as known, is the shipment made by the Mitchell-Lewis Motor Co., Racine, Wis., through the Racine postoffice, and destined to Petrograd, Russia. Owing to the refusal of the express companies to accept large parcels for foreign shipment, the company was obliged to resort to the parcel post system to facilitate delivery of the parts, which were on a rush order. The parcel weighed 201 pounds and the postage amounted to $96.84. It was necessary to use 129 stamps of the 75 cent denomination and a few stamps of lesser denominations.

JOBBERS, DEALERS AND REPAIR SHOPS

Piston Rings

Preserve Your Power

Davidson Multiple Piston Rings will do that and more.

They will create

LESS FRICTION MORE COMPRESSION
LESS HEAT MORE POWER
LESS WEAR MORE MILEAGE

The motor will not smoke and you save gas and oil.

The **Davidson Multiple Piston Ring** is a flexible two-piece concentric ring with equal expansion at all points in the firing chamber. Fits ring slot tight. Makes it impossible for gas, oil or carbon to fill slot or clog concentric ring.

Write for literature.

DAVIDSON MULTIPLE RING CO.

Cylinder Grinding and Parts.

Motorists who are interested in having their cylinders reground, or wish to obtain any machine part for any car, domestic or foreign, should get in touch with the Nilson-Miller Co., 1302 Hudson Street, Hoboken, N. J. This company makes a specialty of grinding cylinders, supplying over-size piston rings and fitting them, and they also supply gears and sprockets of every description, and spare parts for all cars. All work is done promptly and at reasonable prices, and correspondence is invited from all of our readers.

Hel-Fi Spark Plugs.

These plugs are guaranteed to prove their efficiency the moment they get into action, and it is claimed that they will save gas and produce more power than ordinary spark plugs. They retail at $1.25 each, and are fully guaranteed. Write for proposition direct to the Motor Accessories Mfg. Co., Division 4, Marshalltown, Iowa.

Why Pay More

The Inland One-Piece Piston Ring.

This is described by the manufacturers as "perfection in a one-piece ring." Positive gas-tight service is guaranteed by the use of this ring and money will be refunded on any ring that fails to give perfect satisfaction after ninety days trial. Although this ring is perfectly and permanently gas-tight, its simple construction allows it to be sold at a low price. Made by the Inland Machine Works, 802 Mound St., St. Louis, Mo. Dealers should get the special proposition which is made by this company.

Connecticut Electrical Specialties.

A large line of electrical specialties for the motor car is manufactured by the Connecticut Telephone & Electric Company, of Meriden, Conn. This line includes lighting switches of the most approved design, also headlights, side and tail lights, dash lamps, and almost everything of an electrical nature to be used on an automobile. A trade catalog illustrating and describing their full line will be sent on request.

Waterhouse Welding Outfits.

Thousands of garagemen and repair shop proprietors have already installed oxy-acetylene welding equipments, but many others could do so to advantage, and the cost of a good outfit is surprisingly low. The Waterhouse Welding Co., 16 Pelham Street, Boston, Mass., is selling an entirely dependable outfit complete for $42.00, with 5 per cent discount for cash. If any welding materials are desired, it is necessary to add $4.50, which is also subject to a 5 per cent cash discount. Correspondence is invited.

Disco Starter for Fords.

One of the pioneer devices for starting or lighting the Ford car was the Disco Single Unit System. This device is simple, light, easily installed and reliable. It operates on a twelve-volt current, spinning the motor no matter how cold the weather. It charges the battery at a low engine speed, insuring a full charge at all times. It is absolutely automatic in operation with no adjustments to cause trouble. It is so strongly built and durable that it will give efficient service throughout the life of the car. The device sells for $75 complete, f. o. b. Detroit. Some good territory is still open for a few more responsible and live dealers. The manufacturers have an extraordinary proposition to make to car owners, dealers, jobbers and manufacturers. Write for full particulars direct to the Disco Electric Starter Corporation, Detroit, Mich.

Differential and Transmission Gears.

A complete line of differential and transmission gears and sprockets is manufactured by William Ganschow Company, Morgan and Washington Blvd., Chicago, Ill. These are made for all makes of cars and can be relied upon to be accurately machined, and of the highest grade material.

The Ambu Electric Trouble Shooter.

This is an exceedingly handy tool for use in any repair shop. The manufacturers state that it will save a great deal of time and labor as it enables you to locate any electrical troubles in the starting, lighting and ignition systems of the car. The attention is called to the fact that there are about 250 places for trouble in every one of 50 or more types and adaptations of starting and lighting systems, but the Ambu Electric Trouble Shooter will locate any of these defects instantly and automatically. The manufacturers of this device provide an attractive sign for any dealer, garage owner or repairman who is equipped with one of these trouble shooters, and car owners will learn to look for garages and repair shops displaying this sign. Interested readers are urged to write immediately for Ambu Repair charts, service bulletins, instruction book and other literature and be sure to address all your inquiries to the American Bureau of Engineering, 1018-1036 Wabash Ave., Chicago. So that your inquiry may be identified with this publication you are kindly urged to use the coupon attached to the advertisement of this company in our magazine.

Firestone Gets Perpetual Injunction.

Judge Vickery, in the Court of Common Pleas, Cuyahoga County, Ohio, December 16th, granted the Firestone Tire & Rubber Company, Akron, Ohio, a perpetual injunction against a raincoat company using the name "Firestone." This raincoat company was operating stores in Cleveland, Indianapolis and Detroit under the name of Firestone Raincoat Company."

Manley Garage and Shop Equipment.

A large number of handy machines and appliances for garages and repair shops are manufactured by the United Engine and Manufacturing Company, of Hanover, Pa. Their line includes auto presses, air compressors, portable cranes, portable table benches, engine stands and many other similar machines.

MAKE WINTER RIDING AS LUXURIOUS AS A SUMMER DAY

During the cold weather, irrespective of the temperature outside.

Eliminating the necessity of storing your car in the garage during extreme cold weather.

The Utility Heater is simplicity itself. The regulating valve is at the side of the heater within easy reach.

No Expense Added to the Car Upkeep

As the heat is the exhaust from the engine, which is otherwise wasted in the muffler.

No Odor or Noise. Burning of the Finest Material or Shoes Impossible

Cannot overheat or cause back pressure in the engine.

A half an hour is all the time needed to install. Only two small holes in the floor of the car and one in the exhaust pipe.

Handsomely furnished in nickel with all necessary attachments.

In ordering please give outside diameter of exhaust pipe before it enters the muffler.

UTILITY HEATER Complete, - $15.00
Utility Junior Heater (For Fords), $10.00

Dealers Can Make Money Handling This Needed Accessory

The Utility Socket Wrench Set

A set of automatic adjusting socket wrenches that takes all hex nuts from 5/16" to 7/8" and all square nuts from 1/4" to 13/16". The harder you pull, the harder the jaws grasp the nut. Made of the finest steels. Invaluable about the car.

Set of Three with T Handle, - - $2.50
Same Set with Detachable Brace also, $3.50

Warm Hands With STEER WARMS

This wonderful device keeps the hands warm in zero weather. With Steer Warms one can drive for hours on the coldest day and never grow numb or chilled. Steer Warms make winter driving a pleasure. They consist of two neat, leather covered grips, electrically heated from storage battery or magneto, that lace on steering wheel at any place convenient for driving. Anybody can install Steer Warms. No holes to bore—lace on—wire up—that's all. No cost to maintain.

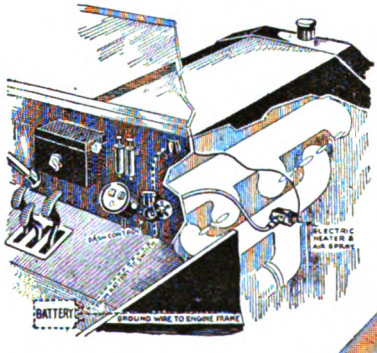
Guarantee: The leading dealers stock Steer Warms. This proves their merit. The manufacturer guarantees Steer Warms for five years. This protects the user. Money refunded if not satisfactory.

Prices:

		In Canada
All Standard Gasoline Cars	$7.50	$11.00
Special Ford Type	5.00	7.25

(When ordering state voltage of battery. If Ford, whether '14 or '15 model.) Purchase from your dealer. If he hasn't them, we will ship prepaid upon receipt of purchase price, or C. O. D.

IECO ELECTRIC MANIFOLD PLUG



Starts Car Quick In Coldest Weather

Engine goes on first or second turnover. You don't have to waste time and wear yourself out cranking a cold engine or waste your batteries on self-starter. This electrically heated plug boils the gasoline and puts a hot vaporized mixture into your cylinders. The plug is really many devices in one. It primes from seat. It saves 25% on fuel bills, detects carburetor troubles, and removes carbon deposits. It is easy to install, simple and economical. Special type for Ford makes these cars easy to start.

Guarantee: The Ieco Manifold Plug is guaranteed for 2 years against burn out. Money will be refunded if not as claimed. Purchase from your dealer. If he hasn't it, upon receipt of price we will ship prepaid, or C. O. D.

Price: $5.00. In Canada $7.25

(Ford cars require 6 dry cells. In ordering specify if to be used on storage battery or dry cells.)

Big Money for Live Dealers
Universal Specialties

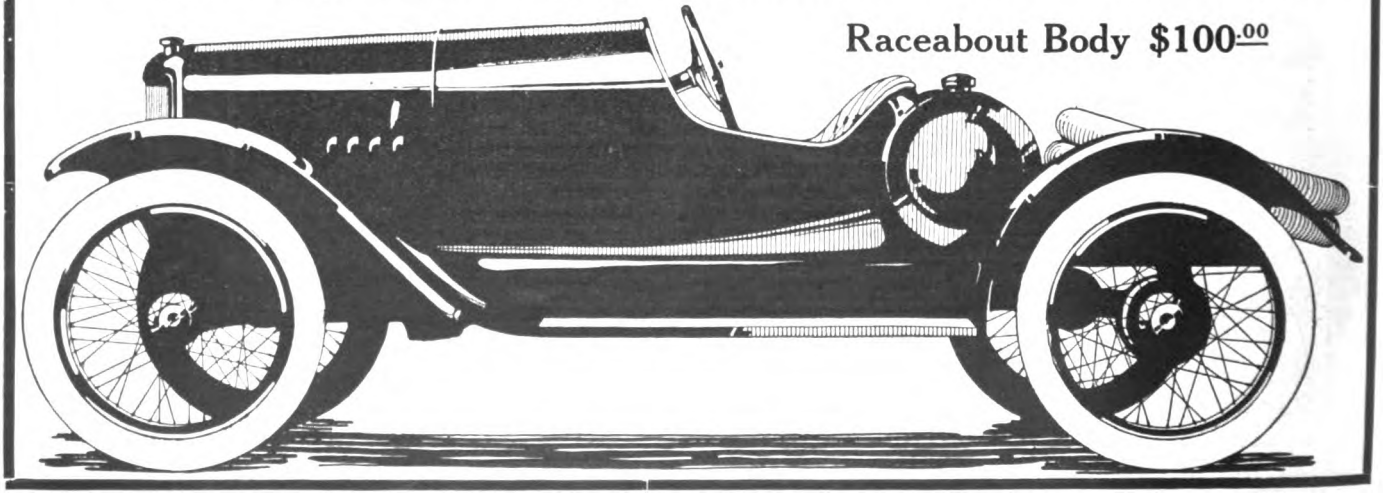
FOR FORDS

Touring Car
Body, $150.00

Touring Body---Raceabout Body
Universal Streamline Radiator---One-Man-Top
Spranger Demountable Rim Wire Wheels

Quick action means money to every dealer that takes on the Universal Line of Specialties for the Ford car. Look them over for yourself. There are no bodies to compete with these—and at such prices! Made by one of the largest body makers in the business—and painted and trimmed in true coach style. Only the bodies of the costliest cars are more luxuriously finished.

The raciest One-Man-Top made is furnished with the touring car. The Universal One-Man-Top for any Ford is a winner in high grade Mohair at $30.00.



Universal Streamline Radiator with Hood is bound to be even more popular this year than last. Improves appearance 500%, fits any Model Ford. Get in on this ready seller, $45.00, black enamel or nickel finish.

Universal Demountable Rim Wire Wheels (Spranger Patent), are the latest and best in wire wheels. A few minutes' talk with your customer will convince him they are the best buy on the market at $35.00 per set (5 rims).

Every dealer should have complete details on the Universal Line. Discounts quoted to bonafide dealers only.

Subjected To This Supreme Test

The New MASTER

Calorite Spark Plug

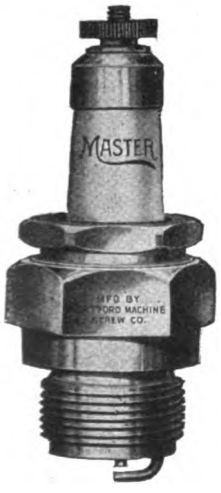
Heated Red Hot - 1500 Degrees Fahrenheit
Plunged into cold water 40 degrees, 26 times

Heated White Hot - 2000 Degrees Fahrenheit
Plunged into cold water 40 degrees, 10 times

An Extreme Change of Temperature of 1960 Degrees

These two extreme tests convinced us absolutely of the marvelous efficiency and ability of Calorite as an insulating material to stand any strains to which it might be subjected in Spark Plugs in the modern motor car. We have long realized the necessity of an improvement and advancement in Spark Plug Construction as evidenced by prevalence of spark plug trouble in last season's races. Our observations, tests, analyses, etc., served to establish the fact that the seat of the trouble mostly was in the insulators.

Our MASTER shell design—our MASTER electrodes and the metal used in MASTER Spark Plugs have proven themselves eminently satisfactory and scientifically correct—there was no necessity of even considering a change there.



Until Calorite, the new insulating material was discovered, our porcelain was the best material obtainable for spark plug insulators. But, with the discovery of Calorite, the old belief in porcelain was shattered. The merits of Calorite are so many and it is so superior to porcelain that to continue using porcelain for our insulators would not be doing justice to the other Master quality specifications—nor to our long established policy of manufacturing only the best.

Calorite Makes Masters the Leaders

We saw its wonderful advantages—
We realized that we had at last found a material which should make us the world's leaders in spark plug manufacture.
But we could not afford to take the slightest chance of making a mistake—and we didn't.
We had made a wonderful success with our Master porcelain plugs—
If we were to change, the new material must be able to stand any abuse—
And so after exhausting all ordinary methods of test we determined to subject Calorite to the most brutal and destructive strains imaginable.

The First Test

Heated until white hot, 2000 degrees, and then plunged into cold running water. This heating and cooling was repeated—ten times—the MASTER CALORITE SPARK PLUG alternately heated to this terrific temperature and plunged into icy cold water.
The internal stresses set up by this instant change from white heat to icy coldness were terrific—yet the CALORITE insulator was just as sound after being put through this radical test as before being subjected to these immense temperature changes.

The Second Test

To exhaust every means of possibly wrecking this material, our engineers attempted a breakdown test. This consisted of heating the MASTER CALORITE SPARK PLUG to a red heat, 1500 degrees and instantly plunging it into cold running water. This alternate heating and cooling was repeated 26 times. MASTER CALORITE SPARK PLUGS came through both of these tests unscathed.
The remarkable qualities of Calorite were all demonstrated after it had emerged from these terrific tests.
Then and only then did we decide to adopt Calorite as the one and only material suitable to make Master Spark Plugs the actual leaders.
Porcelain a few months ago seemed the finest, most practical material for spark plug insulators.
BUT—the finest samples of porcelain—subjected to a fair test along with Calorite did not meet in any way the requirements we sought.
We wanted to be fair—
We gave porcelain its chance—but it couldn't stand the gaff—
Some of the best samples of porcelain—subjected to the same tests as Calorite—heated white hot—broke the first heating—never even got to the cold water.
MASTER CALORITE PLUGS will not break in service—no matter how severe.
Won't soot.
Won't leak compression.
Won't give any trouble at all—we have tested them in every variety of service and we know.
In Calorite we have adopted a material for the insulators of Master Plugs which easily makes Masters the most dependable, longest lived spark plugs in the world.
This plug should prove the most remarkable seller that has ever been offered to the motorists of the country.
A guarantee which is most liberal and comprehensive goes with each plug.
Every Master Calorite is now packed in a round wooden box decorated with a label which in itself attracts the customer's eye.
The progressive dealer and jobber will reap the harvest which will come to those taking this plug on first.
Write for the story of Calorite and Master Plugs and for complete information on the advantages of handling these remarkable plugs.

JOBBERS and DEALERS—A new schedule of quantity prices go into effect January 1st. The Trade will be advised specifically ample time in advance.

With AMBU and AMBU Service

You Can Be the Electrical Engineer of Your Community.

Get the edge on your competitor by getting your AMBU outfit first. The motorists of your neighborhood will recognize in you an authority on electrical work of automobiles, and AMBU Trouble Shooter will enable you to correct the troubles on any make of American car quickly, accurately, and at a tremendous profit!

AMBU

TRADE MARK

Electric Trouble Shooter

Detects—Locates any trouble in any American made Starting and Lighting System used as standard on any American made car. Accurately and Quickly—

Autolite, Remy, Bijur and Rushmore, Delco Westinghouse, Dyneto and Entz, Gray & Davis Splitdorf and Aplco, North East and U. S. L. Wagner and Ward Leonard, Adlake, Deaco, Disco Allis-Chalmers, Bosch, Jesco, Esterline, National Leece-Neville, Simms-Huff

TELLS HOW TO CORRECT IT.

AMBU makes electrical repairing as simple as A, B, C. Nothing that is difficult to understand is embodied in its design or principle. After the dial indicates location of the trouble, you refer to the handily indexed charts and diagrams which give you a complete and thorough working knowledge on how to repair the trouble. And without a minute's delay you are enabled to make the proper repairs on the starting and lighting system under test.

AMBU SERVICE

AMBU Service is really a complete education in the application, details and workings of the various types of starting and lighting systems as installed in the various makes of motor cars.

AMBU Service consists of AMBU wiring diagrams—showing the exact layout of every electrical system as applied to automobiles.

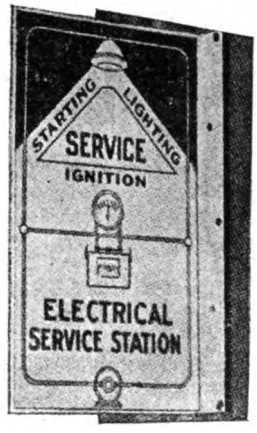
AMBU Repair Charts—giving concise and practical working information and complete instructions on how to make repairs quickly and positively.

AMBU Service Bulletins keep you posted on all changes, additions and improvements which may be made in the various systems.

AMBU Engineering Advice—to help you out of any unusual difficulties.

AMBU Instruction Book—compiled by experts, gives you a complete working knowledge of the various makes and types of electrical starting, lighting and ignition systems.

The complete AMBU Service contains information impossible for you to obtain in any other way—classified, systematized, readily accessible, and filed in a handsome, substantial metal case with lock—a compact authoritative Service.



The possession of AMBU will benefit you to the extent of hundreds of dollars. It saves hours of time, makes an expert of you—it brings you hundreds of dollars of extra repair work because you know how to do the work.

The Starting, Lighting and Ignition Service Sign

Your place of business is identified by a handsome enameled sign furnished by the American Bureau of Engineering.

Car owners will learn to look for garages and repair shops displaying this sign—as the proper place to obtain dependable, authoritative repair work on the electric starting and lighting system.

Hundreds of repair and garage men are now using AMBU. If you are not—fill in the convenient coupon today for detailed information regarding this remarkable instrument and service.

Read What C. J. HENDRICKS Says:—

The American Bureau of Engineering, Chicago, Illinois.

GENTLEMEN:—I want to tell you of the really remarkable success I have had with your AMBU Trouble Shooter. It really looked improbable to me for this instrument aud system to accomplish the work your representative told me it would until I had tried it in actual operation in my own hands. I have had some difficult jobs that otherwise I would have had to turn over to the equipment's service station, and I used to pride myself on my knowledge of electrical equipments. I know I have lost several good customers on account of my taking too long and then finally find out that it was some small thing that if I had known right where to go first, I could have fixed in a short time. The beauty of your instrument is that it automatically tells me right where to go first. I am advertising it now and gradually getting my lost trade back and lots of new customers. I am more than making it pay for itself and I now feel that the price is not high considering what it does. There must have been an awful lot of work necessary to perfect it.

I have just finished a difficult job and my enthusiasm in fixing it in so short a time prompted me to sit right down and write you about it.

Hoping you have the best of success with this proposition, I am,

Yours truly, (*Signed*) C. J. HENDRICKS.

HART-BELL CARBON REMOVER

A Success for the Dealer—
A Success with the Car Owner.

IT'S that kind of a proposition—for there's a **real** demand for a **real** carbon remover and car owners were quick to realize the value of the Hart-Bell Carbon Remover. Evidence of this is thousands of orders coming in from all over the country and countless letters of highest endorsement from users.

But we need more live dealers to help us distribute. We do not ask our dealers to buy our goods until they have felt the demand, so we have a special co-operative selling proposition that we will submit to the dealer who believes in being stocked and organized ahead of his competitors.

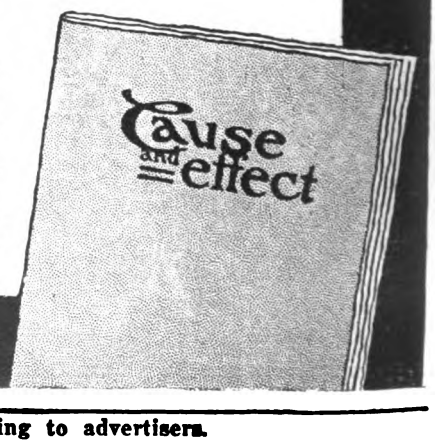
The HART-BELL CARBON REMOVER is a device for introducing live steam into the cylinders of the motor. Carbon cannot be dissolved, only loosened, and live steam is the best agency for loosening carbon. The carbon is then blown out through the exhaust while the motor is running. The HART-BELL CARBON REMOVER is permanently attached (you can attach it yourself), and can be used as often as desired.

There are two million car owners who will want the HART-BELL CARBON REMOVER just as soon as they hear about it.

A REAL BUSINESS OPPORTUNITY FOR LIVE DEALERS.
Write at once for our co-operative selling plan.

$5.00 COMPLETE

Satisfaction guaranteed or money refunded



Send for Free Booklet

"Cause and Effect," explaining the merits of the HART-BELL CARBON REMOVER.

See the Hart-Bell Carbon Remover at the Auto Show, at New York, 4th Floor, Booth D-220.

We guarantee that the HART-BELL CARBON REMOVER will do all that is claimed for it, and if found unsatisfactory the full purchase price will be refunded upon return of same, within ten days, to agent from whom it was purchased, or from us if purchased direct. You run no risk whatever.

INLAND
1 PIECE PISTON RING

A perfect one-piece Piston Ring

that has all the virtues of eccentric, concentric and more-than-one-piece construction; and none of their disadvantages.

A continuous ring cut spirally for half its circumference; heat-treated so that the free ends hug tightly together; the result is an absolutely *gas-tight* ring that uncoils in expanding, insuring uniform pressure and perfect contact with the cylinder walls.

The strongest gas-tight ring on the market, because of its simple one-piece construction, and, for the same reason, it costs less to buy, and less to install, for it is easier to put on and will not break in handling. Made of close grain cast iron.

Absolutely guaranteed; money refunded on any ring that fails to give perfect satisfaction after 90 days' trial.

Full description in free booklet.
Dealers and jobbers should write for interesting prices.

CARBON-NOT

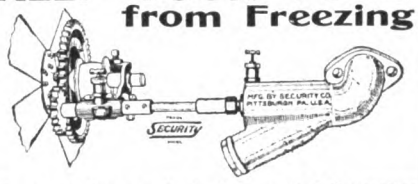
What CARBON-NOT Is

Carbon-Not is a pure compound in liquid form, which, when injected into the cylinder through Spark Plug hole, or valve cap, while motor is warm, will act only upon carbon deposits therein.

What CARBON-NOT Will Do

Carbon-Not cleans carbon from pistons, cylinders, cylinder domes, valves, valve stems, valve caps, without dismantling motor, if just injected and allowed to stand fifteen minutes to three hours, in accordance with the amount of carbon accumulation.

What CARBON-NOT Will Not Do



What Carbon-Not will not do. Carbon-Not will not corrode or injure your metal, impair your lubrication, or emit volumes of smoke after using.

A new type of piston ring that saves power and money

PERFECTION rings are made of 1-16" sections of special soft elastic steel. The openings in the various sections come at different points, causing the ring to always present a barrier to the escape of gas from the firing chamber. Also an equal spring tension at all points gives perfect bearing on cylinder walls. Easily applied, cannot be broken in putting on, cause less friction, save power, reduce carbon and keep down gasoline repair bills.

More Money for the Garage Man!

There is more money in repairs to electric starting and lighting equipment than in any other department of the garage business. The demand is enormously increasing.

The garage man who is equipped to handle this business will quickly do the biggest business in his locality.

Don't drive your customer to other garages for his electrical adjustments and repairs. If you do, he will take his supply trade with him.

Weston Model 280 GARAGE TESTING INSTRUMENT

is the best, the most reliable and therefore the cheapest electrical equipment for you. It enables you to promptly and accurately determine the condition of the electrical equipment of any automobile, just where the trouble is, and just how to remedy it.

We will make you a **SPECIAL PROPOSITION** that will interest you greatly. *Write us today.*

PAINT YOUR OWN CAR—Save $25 to $50

Our big, 36-page book, "THE CAR BEAUTIFUL," is the recognized authority on the Home Painting of Motor Cars. After reading it, you yourself, without previous painting experience, can successfully repaint your car or only revarnish it, or enamel the hood and fenders, enamel or silverplate the lamps, etc., redress the top and cushions, paint the wheels a different color—in fact, do anything you otherwise would have to pay a professional painter big money to do.

During the past eight years, thousands of motorists have successfully painted their own cars with our materials. The Arsenal System of repainting Motor Cars (for novices) is one of the big successes of the industry. DON'T SPEND A CENT FOR PAINTING MATERIALS UNTIL YOU HAVE READ THIS BOOK. Send for your copy today. It is FREE.

How to Become an Expert Automobile Mechanician

The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical simplified instruction on everything you OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine; from the construction of different type axles to the sleeve and rotary valve type of engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. For instance, under the subject of storage batteries you learn how to test a storage battery with a hydrometer instead of a pair of pliers.

Step by step you advance until you are a real expert on timing the valves and ignition. You learn the carburetion subject so thoroughly, you can adjust any make.

Delco, Ward Leonard, Entz, Westinghouse and all electric starting systems will be clear in your mind.

It is chucked full of just the things you OUGHT to know and want to know. There are over one thousand seven hundred and fifty illustrations—simplified illustrations, which, in most instances, explain without the use of the text.

As stated above, the illustrations are SIMPLIFIED; take for instance the illustration of the Atwater-Kent Ignition System, the illustrations show in detail all the INSIDE parts, and just how the coil is wound, how the depolarizing switch operates and why it is necessary—in other words, all detail usually omitted by others is included.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

DYKE'S AUTOMOBILE and Gasoline Engine ENCYCLOPEDIA

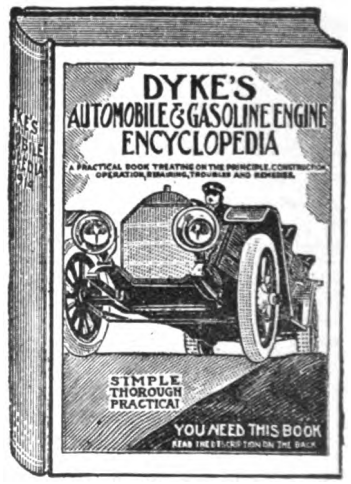
REVISED, ENLARGED, FOURTH EDITION NOW READY

Price $3.25, Prepaid

THE LATE EDITION AT LEAST ONE HUNDRED PER CENT BETTER . . .

A Complete Ford Instruction

added—as well as many other subjects. Some of the new subjects added are; **Electric Starters, Generating and Lighting Systems**, up to date.



How to Time Valves and Ignition—simplified so a ten-year-old boy can understand.

Six, Eight and Twelve Cylinder Engines; every detail from construction to firing order—simplified.

The Repair Subject—greatly improved and many new illustrations added. This subject improved at least a hundred per cent.

Complete Digest of Troubles which will make an expert of you—one capable of diagnosing troubles, scientifically—by a process of elimination—many other subjects added—such as trucks, tractors, etc.

Over one hundred thousand DYKE books sold, not one returned.

A teacher, guide and reference on everything pertaining to motoring. Simple as the a, b, c's.

It's worth ten times its cost if only placed on the shelf and used as a reference when you are stuck.

Last edition, 1,000 illustrations, 596 pages. This new fourth edition, 1,750 illustrations and 640 pages.

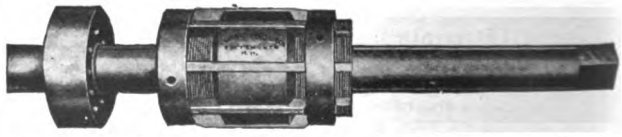
HEISER'S IMPROVED CYLINDER REBORING TOOL FOR FORD ENGINES

REPAIRMAN

There has been a period in your life that you were unable to tell a valve from a spark plug, a magneto from a carburetor, or a cylinder from a piston; some one had to tell you what these parts were and their function. The troubles arising from these and other parts of a car, you have mastered, but you are still at sea if you do not understand and are not prepared to rebore and fit oversize pistons, for this is the most important repair that can be given a worn engine.

The HEISER IMPROVED CYLINDER REBORING TOOL for Ford Engines, makes a good shop out of a poor one and a better shop out a good one, but best of all, it gives the owner service. The end of this season will see one million Fords on the highways; this means many million dollars will be spent on reboring and fitting oversize pistons.

The early bird catches the worm. We furnish oversize pistons to fit the rebored cylinder, $1.50 each, Complete.



Write for further particulars about this wonderful tool.

SPITLER PUNCTURE PLUGS

The Spitler Puncture Plug repairs punctures in automobile inner tubes quickly and without the use of cement, assuring a safe, permanent and economical repair.

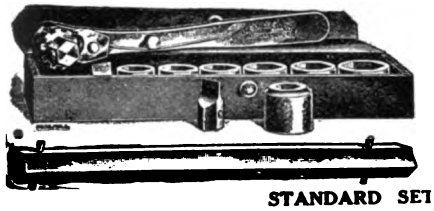
The operation is so simple that a lady can make the repair without soiling her hands.

The plug can easily be taken out and used over again. A permanent repair in one minute.

To insert The Spitler Puncture Plug into the puncture, wet the tube before inserting plug.

Place the base of plug on edge and by stretching the tube at point of puncture, the plug slides in like a button in your coat. Then place cap over discs and screw lock cap firmly.

The Spitler Puncture Plug positively cannot cut the tube nor injure the fabric of the shoe for the principle is the same as the air valve on the tube.



Write for Circular.

Price—Four to a Set, $1.00.

(Patented May 11th, 1915.)

Oil on the roadway usually indicates packing that doesn't pack

Any packing in transmission, differential or crank cases that is destroyed by oil, grease, gasoline, hot or cold water is unsuitable for the service, and is sure to not only cause constant trouble, but is also expensive and wasteful of both lubricants and parts lubricated.

Endura Sheet Packing is made especially and only for oil, grease, gasoline, hot and cold water connections, and therefore always assures the user of tight joints in just the places where ordinary packing must fail.

We will gladly mail you free samples and a chart, "How to Pack the Car," if you'll send the coupon.

The Foundation of this Tire

is just as good as the day it was bought. Any tire with good fabric, whether there is any rubber on the outside or not, is suitable for the

TRIPLE TREAD PROCESS

The Triple Tread is the only tire protector made

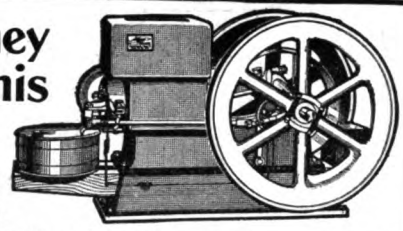
that does not depend on inflation, rim pressure or mechanical means to hold it in place, so that the style of bead on your tires cannot affect the success of their treatment.

In Vulcanizing the Triple Tread on your Tire

we are able to fill the pores of the leather with rubber, making it waterproof, so that by bringing the leather down the sides and over the bead of the case, covering it completely, we are able to keep dirt and water from getting under the tread to rot the fabric, and also to strengthen the sides and bead of the tire.

Write for our booklet,

"Worn Out Tires Made New."



Please mention the size of your tires.

THIS IS YOUR TROUBLE

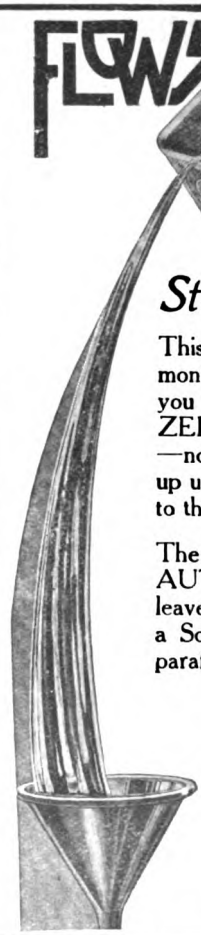
WASTED FUEL
LOST ENERGY
PISTON SLAP

When your motor is worn or cylinders scored the explosive pressure will escape down between the sides of the piston and cylinder walls and the fuel used to produce this energy is lost. This condition of your motor causes a waste of fuel, which necessarily increases the cost of operation and causes that misery of nerve-racking noise.

With your cylinders reground and new pistons and rings fitted, your motor will run like new, will have more power, smoother and quieter running. Where the cylinders are scored, we puddle in molten iron and thus retain the original strength of the cylinder walls.

We specialize in this work and have the most modern and complete equipment in the country. This work is done by skilled engine mechanics. Satisfaction is absolutely assured.

AUTO MACHINE WORK, wrist-pins, gears, crank shafts, bushings and valves.



Don't delay—ship your cylinders, or write us.

THE MOTOR ENGINEERING COMPANY

Automobile Engineers, Machinists and Designers

1688 West 3d Street CLEVELAND, OHIO

FLOWS FREELY AT ZERO

Starts with the Engine

This is most IMPORTANT during winter months. You should know whether the oil you are using "FLOWS FREELY AT ZERO." All oils do not possess this feature—notably the paraffine-base oils, which thicken up under cold, and often cause great damage to the motor.

The safe way is to ask for SUPREME AUTO OIL—it "flows freely at Zero," and leaves no carbon, owing to the fact that it is a Southern Asphalt-base Oil, containing no paraffine to gum, stick and thicken.

Dealers—We make you a most liberal and attractive proposition. Write to-day.

A Real Welding Outfit

$50.00

SIMPLE — DURABLE — RELIABLE

It is all that the Cox Standard implies—so complete, you can hitch it to your gas tanks and handle any job that comes to you after a little practice.

Scientifically built to do good work by experienced welder manufacturers and to do this work cheaper than you can do it now by any other means.

Guaranteed against mechanical defects by a company that has made high grade successful Welders for years.

You can do any automobile or machine welding job with it. You can straighten bent frames and axles—add metal to weak or worn parts and put new teeth n stripped gears.

It has been done. Can you think of any better proof that this

$50.00
Welder is right!

FOR "LEAKY CYLINDERS"

PISTON RINGS

Your Safeguard

LESS CARBON-MORE POWER

EVER TIGHT PISTON RINGS have perfect elasticity from three points, meaning an even distribution of pressure all around, and a decrease in friction. You do not have to rebore cylinders.

A FEW "EVER TIGHT" FACTS

EVER TIGHT PISTON RINGS produce perfect compression
EVER TIGHT PISTON RINGS produce more power
EVER TIGHT PISTON RINGS decrease maintenance cost
EVER TIGHT PISTON RINGS eliminate carbon troubles

The Ever-Tight Piston Ring Co., Indianapolis, Ind.
St. Louis, Mo. July 8, 1915.

Gentlemen—

With reference to my recent trip from San Diego to New York in a Stutz Bearcat, in eleven days, seven hours and fifteen minutes, I owe much of my success to the EVER TIGHT PISTON RINGS, inasmuch as the car did not lack a bit of power, the way it pulled through the sand and took the hills and mountains was certainly remarkable, the EVER TIGHT PISTON RINGS truly deserve full credit for their reliability.

Yours very truly,
E. G. BAKER

For Sale by all Dealers.

Add $250.00 A MONTH EXTRA To Your Business

REPAIR AUTOMOBILE TIRES

Sounds like a whole lot of money to clear extra every month. Seems almost impossible, but that is what hundreds of men are doing who have added a Tire Repair Department to their business. **The investment is small, the profit large** and **returns quick and all cash,** besides the demand for tire repairing and retreading is constantly growing. Your garage is by no means complete, your business is not as profitable as it can be until you get in on the Tire Repairing and Vulcanizing end.

THE HAYWOOD TIRE REPAIR EQUIPMENT

Answers all the requirements to successfully handle this end of the business. With it and a little business judgment, success is certain. Every year adds thousands of new auto owners. They are looking more and more to economical tire service. The day of discarded tires is over, the Haywood Equipment makes this possible.

HERE IS YOUR OPPORTUNITY

Either as a side line to your present automobile business or as a business by itself, the Haywood Equipment will make money for you. **Tires go wrong all the time.** You know that. Keep them in tune. Give your customers complete service—repair their tires and all. This builds business and makes you rich. Experience unnecessary. You can learn easy—or teach a boy to handle this end. Be the boss and make the money. Learn the details now. Investigate. Act quick. Be the first. Send name and address only. A postal will do.

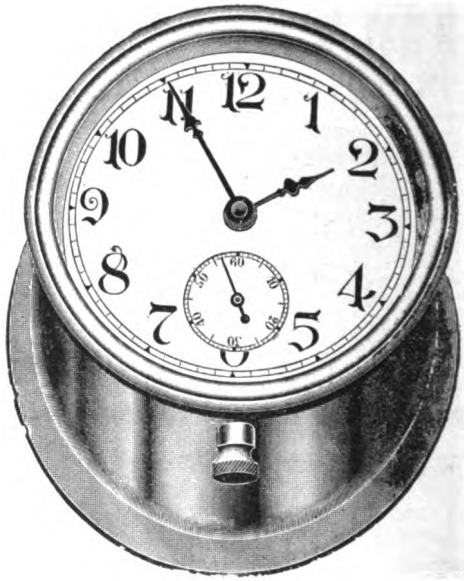
Every Repair Shop or Garage SHOULD HAVE A CLOCK.

We have recently made very favorable arrangements with one of the largest clock companies in this country by which we are enabled to offer to our readers in the United States or its territories a **Regulator Eight Day Calendar Clock** 38½ inches high, with a 12 inch dial, finished in **Oak** or **hand-rubbed Mahogany**, with a subscription to the **Automobile Dealer and Repairer** for one year, at the very low rate of **$3.90.** This clock cannot be sent to any foreign country except Canada, and Canadian subscribers must send **50 cents** more to cover extra postage on the paper.

Every repair shop, garage or dealer's office should have one of these clocks. It will give you the time of day correctly and the day of the month.



The engraving shown gives the correct appearance of this clock.

This offer is good for either old or new subscribers.

Remittances can be made in any convenient way. Be sure to state whether you want this clock in Oak or Hand-Rubbed Mahogany.

Address all orders to

DO YOU WANT A MOTOR CLOCK

For your car, and a good one? The clock illustrated in this connection is manufactured by one of the most reliable clock companies in the country and is warranted in every respect. It is not liable to get out of order. It has interchangeable parts. It is the product of skilled labor combined with the most improved Waltham Automatic Machines. This clock is 3¾ inches high, and 2½ inches in diameter. It has a one day movement with second hand. It can be furnished in burnished brass or nickel plated whichever is preferred. The arrangement we have made enables us to furnish **one of these clocks and a subscription to the Automobile Dealer and Repairer for a year** to all residents of the United States and its territories for the precise price the clock retails for, namely, **$2.50.** If an eight day clock is preferred send 50 cents extra or **$3.00.** Canadian subscribers should add 50 cents extra to cover the extra postage required on the **Automobile Dealer and Repairer.** This clock cannot be sent to foreign countries. The clock can safely be sent by mail and will be forwarded postage prepaid to any part of the country. Remittances can be made in any convenient way. Address

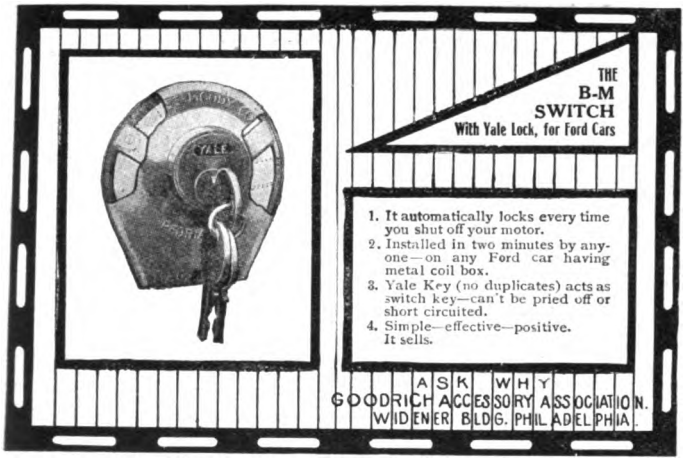
KENNEDY AUTO STORAGE COVERS

To meet the need of an inexpensive and efficient cover for automobiles while in dead storage we are making a paper cover, which is proving the right thing for this purpose.

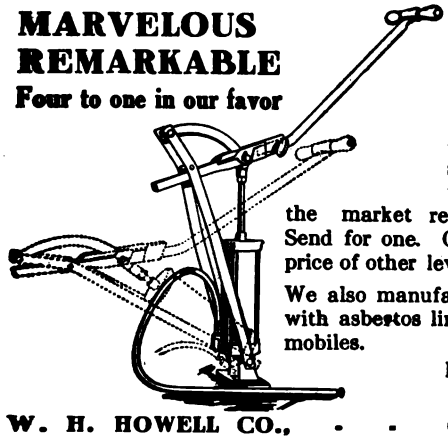
These covers are made of strong heavy paper, properly reinforced to prevent tearing.



They protect the car against dirt, dust and moisture and will prevent the polished portions from tarnishing and the finish from checking in cold weather.

These covers are salable to individual car owners at a good profit as well as to furnish the dealer a protection for his stock of new cars.

We make them in four sizes: 7 PASSENGER, 5 PASSENGER, FORD SPECIAL, ELECTRIC.



Winter will soon be here and dealers can handle these covers with satisfaction and profit. Further information on request.

For both tubes and casings of any size.

Burns gasoline. Requires no watching as the heat is automatically controlled. Water put in at factory and never needs refilling. No danger of burning a tire with ***Steam,*** which is used by ***all*** tire factories and repair plants. Vulcanizing curved to fit casings, and clamps against plate for tubes. Nickel plated. Full directions and all supplies with each outfit.

Pays for itself many times over during a season. No experience required. Write for free catalog.

PRICE BY MAIL PREPAID, $2.25

The NISWANDER TIRE RIM REMOVER

If you have ever had occasion to repair the tires in your auto, you will appreciate the merit of our demountable rim remover. They fit any rim, regardless of make or size, are small and compact, yet strong and substantial, and are so simple that there is nothing to get out of order about them. Fig. 1 shows the device contracting the rim. Fig. 2, expanding the rim and forcing it back into place in the tire. Fig. 3 shows the device folded to a length of Ten inches, and as the weight is but 2½ pounds, it is a great device requiring very little space. They have a polished nickel finish and therefore will not rust. This device can be purchased from any dealer for the sum of $3.00, but if your dealer does not have them, we will on receipt of the above price, send you one by prepaid parcel post.

NISWANDER MFG CO., :: Quincy, Ill.

ZENITH CARBURETOR FOR FORDS

$20 COMPLETE
Including Manifold and Hot Air Tube.

Give to your Ford the same flexibility, power and economy that this carburetor has given to the world's best cars. That unpleasant jerky engine-pull when changing from low to high or when throttled down is entirely eliminated. Insures easy starting and wonderful economy.

Literature mailed free on request.

Trial Offer
If after 30 days' trial the Zenith Ford Carburetor is not well worth the price return it at our expense and get your money back.

Patent Applied For.

KANT SLIP
INNER LINER

Is one of the best on the market, as it cannot slip inside of the casing. When this liner is placed inside of the tire, and the tire properly inflated, the liner

WILL STAY JUST WHERE IT IS PUT

And cannot slip.

The Kant Slip Inner Liner is also a complete inside fabric reinforcement, extending the full length of the tire from bead to bead.

NOTICE THE FLAP THAT PREVENTS SLIPPING

Inner Liner can be re-used after old casing has been discarded, wearing twice as long as any other.

Write us at once, if your dealer does not handle them.

80% More Power

Mark the Wonderful Supremacy of the

HUDSON SUPER SIX TRADE NAME REG.

$1375 at Detroit

Patented by Hudson December 28, 1915 Patent No. 1165861

Hudson Super-Six

Eights and Twelves Defeated by a Six

THE facts about the Super-Six seem almost like fiction.

Think of increasing motor efficiency 80 per cent at one jump without adding size or cylinders.

Think of a small, light Six—cylinders 3½ x 5—developing 76 horsepower.

Think of that Six, in official tests, breaking all stock-car records.

Think of a simple, light-weight Six outmatching Eights and Twelves.

And think of a $1375 car proving itself, beyond possible question, the best performing car of the day.

MEN WILL HAVE THAT 80%

This motor's capacity is 288 cubic inches. The best former motors in that size delivered about 42 horsepower. The Super-Six delivers 76 horsepower.

Any motor which shows about half that efficiency will have no attraction now.

This extra 80 per cent means more than added reserve power. It comes through ending vibration. All this super-efficiency comes through saving power which former motors wasted within themselves.

So it means vast economy. It means such smoothness as you never have known before. It means matchless flexibility. It means, as shown by official tests, record quick response.

Every quality men prize in a motor has been bettered vastly in this Super-Six.

EXCLUSIVELY HUDSON

Now, for the first time, a premier attraction is found in one car only.

The Super-Six is a Hudson invention, controlled by Hudson patents. So no other car will have it. And any like performance is impossible without it.

Eights and Twelves of the finest types have been utterly defeated. Every reason for a double motor, with its extra weight, has vanished. Not a Six of the old type has any chance in comparison.

So this invention gives the palm to Hudson, over all cars in the field. One ride in the Super-Six will convince you of that.

$42,000,000 OUTPUT

We have doubled our factory because of this invention. And we shall build this season $42,000,000 worth of these Super-Sixes.

They come equipped with most luxurious bodies. All that we save by this doubled production has gone into extra elegance.

So the Super-Six will stand supreme, both in motor and in looks. Any Hudson dealer stands ready to prove that to your fullest satisfaction.

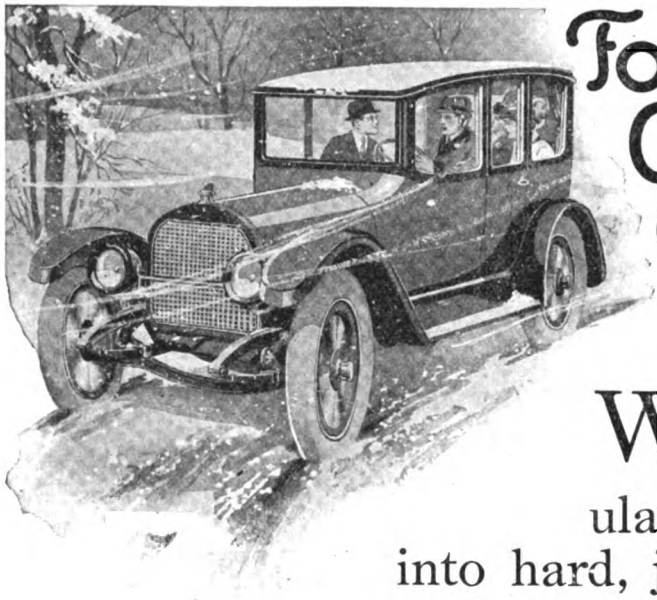
World's Record Breaker

All Records up to 100 Miles

These tests were made at Sheepshead Bay with a 7-Passenger Super-Six—a touring stock car—under official supervision of American Automobile Association.

100 miles in 80 min., 21.4 sec., averaging ***74.67 miles per hour,*** with driver and passenger.

75.69 miles in one hour with driver and passenger.



Two laps made at 76.75 miles per hour.

Standing start to 50 miles per hour in 16.2 sec. A new record in quick acceleration.

For Motoring Comfort over Hard, Winter Roads.....

WHEN the frost has stiffened every irregularity of road surfaces into hard, jolt-imparting hollows and bumps, which keep the springs of your automobile in a constant turmoil of action, the need of the

*Hartford SHOCK ABSORBER

becomes decidedly apparent. The Hartford takes the sting out of every jolt, makes your springs act smoothly and normally, carrying you over road irregularities glidingly, undulatingly, comfortably.

It is then that you realize that all-the-year riding comfort is only possible with Hartford Shock Absorbers on your car.

Send to us for our

Comfort Chart

It tells how to realize riding comfort, no matter where or how fast you choose to motor.

It gives data pertaining to your particular car, whatever its make, year and model.

Free to Car Owners

THE NEW YORK ELECTRIC HEADLIGHT CONTROLLER

FOR FORD CARS—$5.00

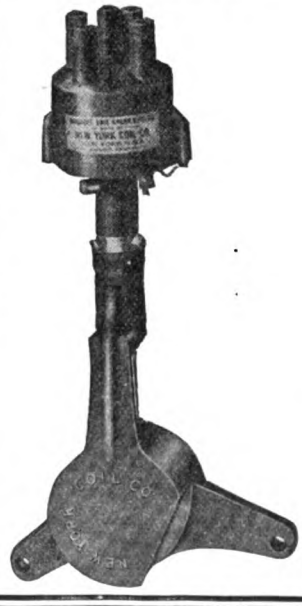
Is a thoroughly practical Lighting System that delivers a powerful, penetrating electric light, fully equal in power to the best Dynamo-storage Battery Systems supplied on the most expensive cars.

You have probably experienced the nerve racking ordeal of driving over strange, dangerous roads with unsatisfactory lights.

Do you remember when you attempted to drive slowly, and found the very act of using caution caused less and less light? And did you later inquire the price of a *different* lighting system, and found the cost was $65.00 to $75.00? Certainly, such prices causes one to hesitate, but when you can secure a System for—$5.00, devoid of all complication and after expense, that you can install in ten minutes, there is surely no occasion to delay placing your order at once—to-day.

The same lamps, generator and switch are used already on your car. Our device automatically delivers the proper current to produce a powerful light at all speeds, without the complexity of storage batteries, extra dynamo, or complications of any nature. This is an ingenious, scientific, electric device, and must not be confused with the resistance coil or other makeshift devices now on the market.

At your Dealer's or will be shipped prepaid upon receipt of $5.00.



The New Rhoades Battery Ignition System for Ford Cars is Ready

This system is new in its entire construction—in no way resembling our old model (or any prevailing design), yet all necessary qualifications of the Battery Ignition System, operated by six dry cells, are retained. This new Model "L" is a revelation in simplicity, reliability and battery economy—it contains no delicate parts subjected to wear and will last as long as your car. Its effect on your Ford is indeed remarkable—you will at once notice a tremendous increase in power, smoothness and flexibility that you have never thought possible. Your motor will throttle down to a walk, yet at a touch accelerate like a six—unevenly applied, jerky power will be absent entirely; in a word, your ignition troubles are ended. *You get the same satisfaction enjoyed by the owner of the most expensive car, as all vibration coils are entirely dispensed with—operated entirely by six dry cells* which supply sufficient current for 2,000 to 4,000 miles running—leaving the Ford Magneto to furnish lighting current exclusively.

We supply a transformer non-vibrating coil of great power, equipped with Kick switch, also an oil type elevating gear bracket containing cut bevel gears, upon which is mounted our new sparker; also *all cables, wire and cable carrying tube*, with instructions that enable you to successfully install in one hour.

PRICE $20.00 COMPLETE

DEALERS! NOTE THESE POINTS!

Our line of accessories for Ford cars is supplied in answer to a *positive demand* and comprises only articles that the Ford owner really requires and which he *can readily install.*

Our long specializing, extensive publicity and the great reputation we have gained through the production of successful patented devices for Ford cars has made our line famous among Ford owners.

Live dealers everywhere are listing our goods. Sales are continuous and the liberal margin of profit makes our line the most lucrative the dealer can handle. We offer every sales help, supplying electros, advertising copy, etc.

Write for our Special 1916 Selling Proposition.

Your Customers Can Best Be Pleased With—

STA-TITE PISTON RINGS

Eternally Tight

In these days of strong competition in your line, every pleased customer is a distinct asset to you. The best way to gain recognition as a progressive and practical automobile man is to give your customers the best possible advice.

When it comes to piston rings, there is only one Sta-Tite, and it is made by the biggest exclusive piston ring plant in the world. It is therefore the leader. To become the leader, there had to be many outstanding superiorities in Sta-Tite Rings—which stood the test.

You may recommend Sta-Tite Rings with the knowledge that you are giving your customers the very best advice. One engineer after another has admitted that our principle is the only one that maintains its original merits after much wear.

When you place yourself in the position of helping your customers—by stopping smoke, oil and compression troubles—you are making profitable friends, who will spread the news. Your business will increase. Which means greater profits.

There is a big story to be told about Sta-Tite Piston Rings and the profits for dealers. If you will but signify your interest, we will tell you this interesting story. It will mean increased profits for you.

The Piston Ring Company, 29 Sanford Street MUSKEGON, MICH.

Largest Exclusive Makers of Piston Rings

Makers also of "Quality" Snap Rings

Protection for the car and for the people who ride in the car, protection for the dealer and for the owner—this is the basic idea that underlies our business. You must pay a big premium for protection from fire, burglary, accident and liability. But you secure protection from wear and tear and rapid depreciation at very low cost when you buy

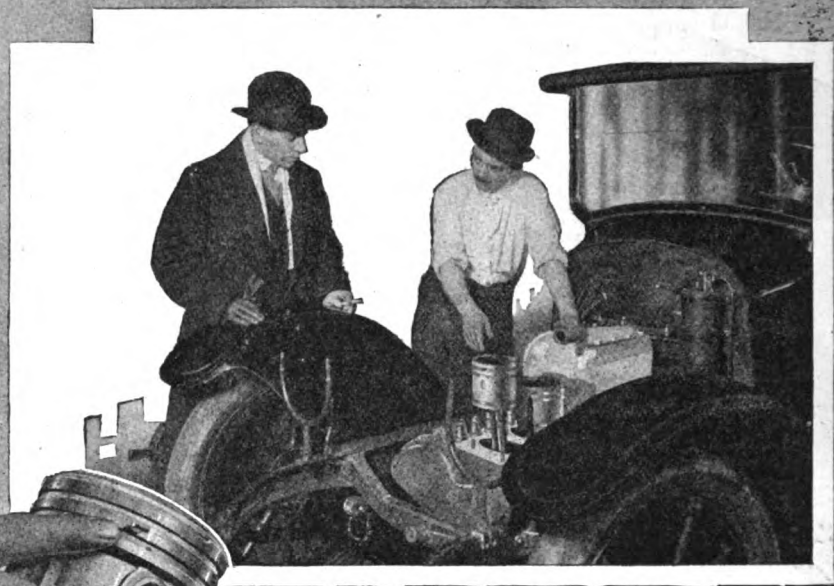
WARNER AUTO UPHOLSTERY COVERS

FIT LIKE A GLOVE

DUST-PROOF WEAR-PROOF

We honestly believe that there are no auto upholstery covers manufactured in America that represent better values, better materials, fit and workmanship than those which we manufacture and sell under our own name. You will realize the truth of this assertion from the moment you snap a set of these covers over your automobile seats. They are especially designed for the car you drive, and are readily attached by means of instantaneous fasteners.

We know that our proposition is better for the dealer because we manufacture exclusively *for* the trade, and sell exclusively *through* the trade: our list prices are fair, our discounts are liberal, our service is prompt and reliable and we guarantee price protection to September 1st, 1916, to all dealers under contract with us.



The cost of everything that enters into the manufacture of Warner Auto Upholstery Covers is advancing by leaps and bounds. If you have not already received our catalog, price-list, swatches, display hanger and dealer contract, write today.

"What You Need Are McQUAY-NORRIS LEAK-PROOF Piston Rings"

Cars will be coming in to you right along now, Mr. Garage or Repair Man, for the spring overhaul. The owners depend on you to say what's needed to insure full power for the summer ahead.

Power shortage is what they've suffered from chiefly. It's taking more gasoline and they've had a lot of trouble with carbon.

The piston rings are responsible. They have lost proper fit and elasticity, which makes them leaky and generally inefficient. That always happens with the piston rings commonly used by motor manufacturers.

You owe it to your customer and to your own reputation as an authority to talk piston rings. Tell him why they are responsible for leaky compression and carbon troubles. Apply the only permanently satisfactory cure—LEAK-PROOF Piston Rings.

The piston rings that never lose fit or elasticity—that give full power always—that don't lose efficiency in a few months of wear.

NO OTHER ACCESSORY OFFERS YOU SO CERTAIN A MARKET

Every other accessory you handle is part of the equipment of several or all cars—or something like it. They're all renewal parts. Not a manufacturer in America uses LEAK-PROOF Piston Rings as standard equipment. You, and you only, have the exclusive control of this market, as we sell only through dealers and jobbers.

Make it a part of every overhauling job you handle to put in LEAK-PROOF Piston Rings. Your customer will see the benefit at once and appreciate it. You'll improve your standing with him and increase his reliance on your judgment. He'll recommend your services to his friends.

Send for FREE Booklet—"To Have and To Hold Power"—the standard hand-book on gas engine compression. It tells what LEAK-PROOF efficiency means. Write Dept. R.

LYNITE-PISTONS ALUMINUM

For FORDS

4 LYNITE Aluminum Pistons fully equipped with LEAK-PROOF Piston Rings, $30.00. The most attractive proposition ever made to a Ford Owner. It gives the Ford motor the kind of pistons that are used in practically all high-priced cars for 1916. LYNITE and LEAK-PROOF make a combination that out-classes anything for producing snap, speed, power, silence and economy in Fords.

Tourabout Body $150.00

Top & Windshield $38.00 Extra

UNIVERSAL Specialties that Revolutionize the Appearance of Any FORD Car

UNIVERSAL STREAMLINE RADIATOR AND HOOD

$45.00

Unless you have seen this equipment you have little idea of how much better any model Ford looks with the Universal Streamline Radiator and Hood. Cooling surface greater—volume of water greater—cooling perfect—engine runs better summer or winter. You actually get a true streamline with a more efficient power plant. This radiator gave universal satisfaction during 1915. The hood is made of heavy gauge steel well enameled and finished. Special hood for models previous to 1915—mention this when ordering. Price, nickel or black enamel finish, complete with special starting crank bolts, etc., $45.00.

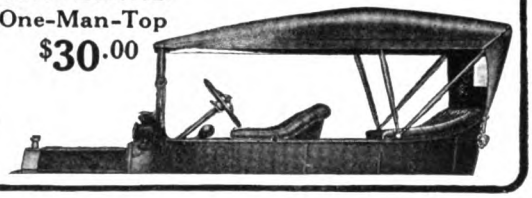
The Universal Streamline Tourabout Body for Ford Cars is strictly a quality job in every respect. Comfortable deep upholstery, real spring cushions, ample leg room, and wide seats combine to make this the most comfortable body ever put on a Ford Chassis. The top and windshield shown are made special for this body and will not fit the regular Ford. Price $150.00, Mohair or Khaki One-Man Top and Rain Vision Ventilating Windshield $38.00, Radiator and Wire Wheels as listed, Crown Fenders $14.00.

The Universal Streamline Raceabout Body for Ford Cars is built and finished in the same careful way. Genuine spring cushions that actually ride easy and deep well-stuffed upholstery. Standard color red with black trim. Hood and fenders come black—radiator black or nickel. Body with 15 gal. tank and tire supports $100.00. All parts f. o. b. Detroit.

Universal One-Man-Top is properly designed (raises or lowers with utmost ease) and is built of high grade materials throughout. Fits any model Ford. Price complete with Boot, Jiffy or Plain Curtains, Rubber Cloth, Mohair or Khaki $30.00.

These Bodies and Specialties Fit Properly and are Applied with Very Little Effort

SPRANGER DEMOUNTABLE RIM WIRE WHEELS



$35.00

Spranger Demountable Rim Wire Wheels are built honestly and carefully by wheel experts and of the best alloys. A substantial hub and general sturdy construction from a thoroughly tested design make each wheel far stronger than actually necessary and allows a liberal factor of safety. There is a substantial saving on tires and increased gasoline mileage; the riding qualities are greatly improved. Easily attached ***without bolts***—front wheels come complete with ball bearings—rear wheels machined to proper taper and Key Seat—go on same as the wheels you take off. Four Wheels—five rims—red, green, black, or yellow—rim wrench—complete $35.00.

Mr. Dealer:

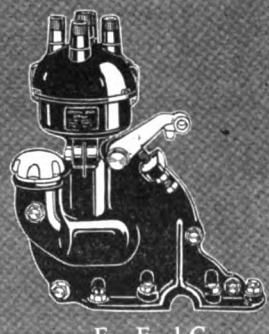
Suppose you offer your customers an ignition system which has already displaced the magneto on more than thirty representative cars—a system not only moderate in price. simple, absolutely dependable and easy to install, but which establishes a new standard of motor performance —a system which is an investment in safer, easier, and pleasanter car control and in battery insurance.

Can you imagine how quickly they will respond?

A single Atwater Kent installation has been known to produce dozens of sales as a result of its owner's enthusiasm.

If you sell automobile accessories your big opportunity is in the sale of equipment of known reputation. Atwater Kent Ignition needs no introduction for quality or permanence. For years it has ranked as the most efficient and high grade battery ignition system.

Comparatively few car owners, however, realize how much their cars would be improved by the installation of this scientific ignition system. No matter what car your customer drives, he is a good prospect for an Atwater Kent System. Get in touch with him and close the sale—send us his name and we will see that he is supplied with full information direct from the factory. We will help you close the sale.



Pick out your fussiest and hardest-to-please customer today. Sell him an Atwater Kent Ignition System on a make-good basis; then decide for yourself whether there is an opportunity for you in Atwater Kent Ignition.

10% increase

ADVANCE in TIRE PRICES

Owing to the largely increased cost of raw materials, we are compelled to advance our prices 10% on the standard sizes of Goodrich Automobile Tires and Tubes, also on Goodrich Wireless Truck Tires, Goodrich Motorcycle Tires and Tubes and Goodrich Automobile Rubber Accessories effective at once.

Occasional or odd sizes of Goodrich Automobile Tires and Tubes advanced will be shown on our price list.

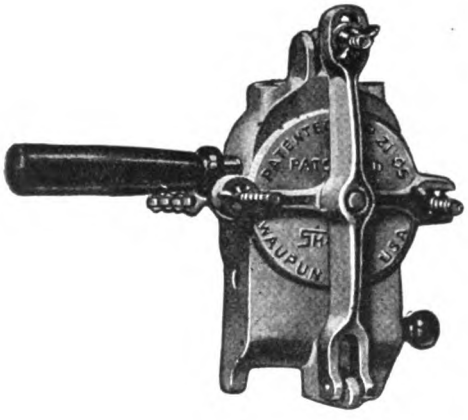
Despite the many advances made by others we have held to a conservative increase, in line with our policy to maintain "Listed" Prices for

THE B. F. GOODRICH CO.
AKRON, OHIO

Chicago Branch: 1925 Michigan Ave.

PRICES on pneumatic automobile tires, all types of solid and cushion motor truck tires and pneumatic motorcycle tires are advanced 10% on standard sizes. This advance [illegible]

Wise Motorists Will



SAVE THEIR TIRES and REDUCE TIRE BILLS in spite of the increased tire prices, by taking care of their tires. They will seal up the small holes with a Shaler Vulcanizer and prevent the exposure of the fabric, keep water from working in and causing blow-outs.

Now, in the face of this increase of tire prices, motorists will save more money than ever with

SHALER Vulcanizer

The Shaler Vulcanizer is simple and easy to use. Any motorist can easily and quickly vulcanize his tires with a Shaler and make the repair permanent and the strongest part of his tire. It requires no watching or regulating. Has no exposed flame. You do not have to fear overcuring or undercuring the rubber. The Shaler has an automatic heat control which provides the exact heat for perfect vulcanization—no more—no less.

WRITE TO-DAY for free copy of Tire Book, "Care and Repair of Tires."

This Is the Shaler Vul-Kit $3.50

It will treble your mileage by keeping your casing cuts and holes sealed up and saves you on tube repairs.

The Tire Dealer's Problem Is *Not* "Who Makes the Most Tires," But "Who Makes the BEST Tires" —The Tires which give his Customers the Most Mileage

No automobile owner buys a tire for any purpose other than that of utility. It is the tire's performance that counts with *him* and *you*—not its color, nor how many thousands of these particular tires have been built.

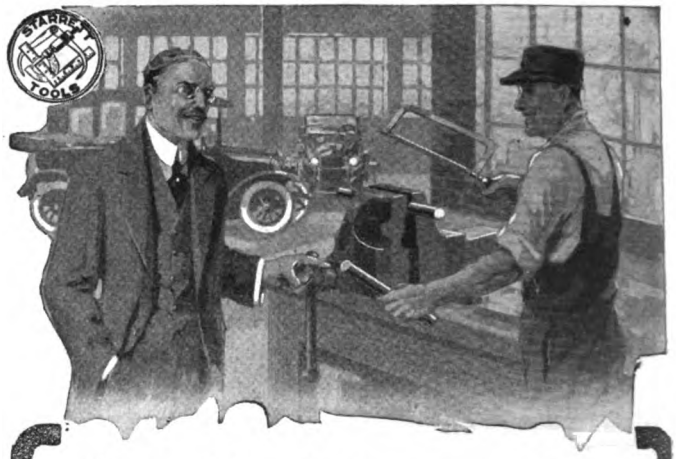
You don't care how many tires we make—but we want you to know
WE MAKE THEM GOOD

Miller

"Geared to the Road"

TIRES

are built by the exclusive Miller method, which retains all the life-giving wax and oil in the cotton fabric—the backbone of the tire—and safeguards the natural resiliency and toughness of the rubber. It welds them into one cohesive and road-defying unit.



Miller has no quarrel with any manufacturer on the subject of mere volume. Miller does not claim to build more tires than other manufacturers. But we do insist that every Miller tire is the best possible answer to any controversy on excess **mileage,** because every Miller tire gives the motorist the **Greatest Possible Average Mileage.**

And every motorist who uses Miller tires and every dealer who sells them knows this to be true!

Let us tell you more about Miller tires and the Miller tire selling plan. Write at once before some other dealer gets the territory.

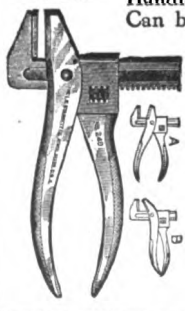
It's Because We Don't Make the MOST That We Do Make the BEST

THE MILLER RUBBER CO.
AKRON, OHIO U. S. A.

"Yes, Sir, It Pays to Use a Good Hack Saw"

Look at that clean cut, boss. I put in just the right blade for the job, and the blade's as good as when I started. I save time, get better work and longer service from my hack saws by using

Starrett Hack Saws



The motorist who makes his own repairs *needs* a good tool. The skilled mechanic does better work—easier work—with a high-grade tool.

Starrett Tools have a world-wide **reputation** which Starrett Hack Saws help to maintain.

There are 21 styles for every shape and kind of metal; 8 styles of frames from which to meet your special requirements.

The STARRETT Expansion Pliers $2.00

Adjustable jaws to fit any shape up to 1¼ inch. Handles always right to get a powerful grip. Can be used as wrench or pliers. The handiest tool for garage, car or home.

Write for 320-page free tool catalog No. 20-DC

Dealers will find it profitable to get our catalogs and terms. We sell direct to dealers.

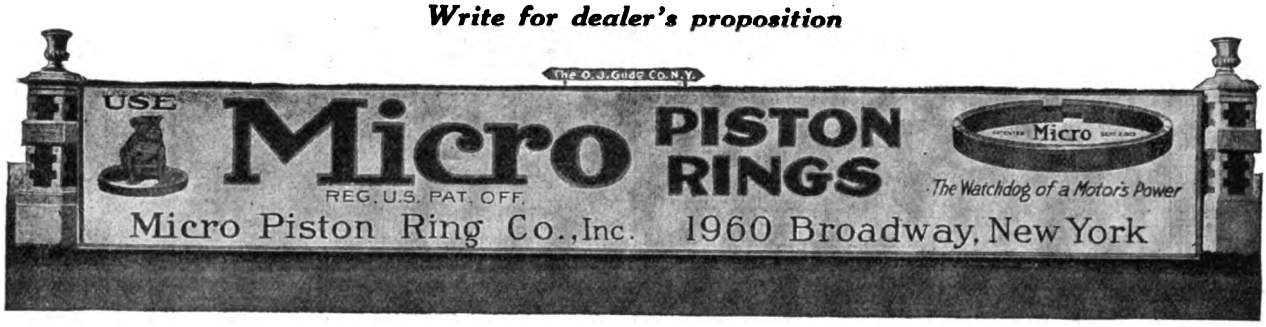
You positively *need* Micro Piston Rings

To keep the explosive mixture *inside* and surplus oil *outside* the combustion chamber.

To get full power without wasting gas and oil.

To lessen carbon deposit, smoky exhaust, fouling and failure of spark plugs.

To keep cylinders tight and valves clean without frequent regrinding.



Three distinct bearing surfaces in firm and uniform contact with the cylinder wall in every direction, and our double sealed joint that stays tight when old as well as while new, make Micro Two-part Pressure-tight Rings quickly repay their cost in bettered service and actual savings.

Throwing out leaky plain rings and putting in Micros often brings worn cylinders back to original efficiency without the expense of reboring.

Micro Rings never break in fitting or lose their resilience in service

"NORMA"

BALL BEARINGS

(Patented)

Dependable ignition—dependable lighting — dependable starting — these contribute mightily to the pleasure-giving, comfort-giving, service-giving capacity of any car. And remember this—the electrical accessories upon which these things depend are no better than their bearings—they "make good" only so long as their bearings stand up to the work.

Practically all high-grade magnetos, lighting generators and starting motors made in America—those used in the better-class cars—carry "NORMA" Ball Bearings. Which is the best of reasons for believing that any other electrical accessory will perform better if equipped with "NORMA" bearings. Try it.

Want the Catalog?

THE NORMA COMPANY OF AMERICA

1790 BROADWAY NEW YORK

Ball, Roller, Thrust, Combination Bearings

EVERY accessory dealer, every repair shop, should carry these items of the "Chemically Correct" line.

SE-MENT-OL

The original self-acting Radiator Cement

The simple science of it is backed up by the practical experience of the garage man. You pour it in. It "finds the leak and fixes it." No tools, no tinkering, no removal of radiator. A lasting repair in fifteen minutes. **Retail price 75c.**

CARBONOX

The "Chemically Correct" Carbon Remover

Loosens the carbon and it is blown out thru the exhaust. It is fatal to engine efficiency to allow carbon to accumulate in a cylinder until drastic mechanical methods are required to remove it. By using Carbonox every two weeks the cylinders can be kept sweet and clean and the engine will be always running at its best.

Retail price 75c.

PIONEER

Valve-Grinding Compound

This is one of our best items and a top-notcher in quality. Uniform in composition, and grinds the valve quickly down to a smooth firm seat. Contains no ground glass nor powdered emery. Sold in several styles of container, one of the most popular of which is the double end box shown herewith and containing 2 ounces of coarse and 2 ounces of fine. **Retail price 25c.**

Other "Chemically Correct" Items:

What Standardization Means to Automobile Buyers

IT means VALUE—the utmost in efficiency per dollar of cost. Just to the extent that a car is standardized does the buyer's dollar approach the maximum of purchasing power.

Standardization means definite, proved, quality, known manufacturing costs and reduced selling costs.

Of the million autos that will be sold in 1916, 75% will be standardized cars selling for less than $1,000 each. This remarkable American achievement is the result of standardizing motors, starters, carburetors, speedometers, ignition and lighting systems, transmissions, differentials, tires, wheels, axles, rims, bearings, etc.

Finally the upholstery has been standardized by the almost universal adoption of

Rayntite Fabrikoid top material, single or double texture, is guaranteed one year against leaking, but built to last the life of the car.

Craftsman Fabrikoid, the artistic and durable upholstery material for furniture and home decoration, is sold by the yard in leading department stores.

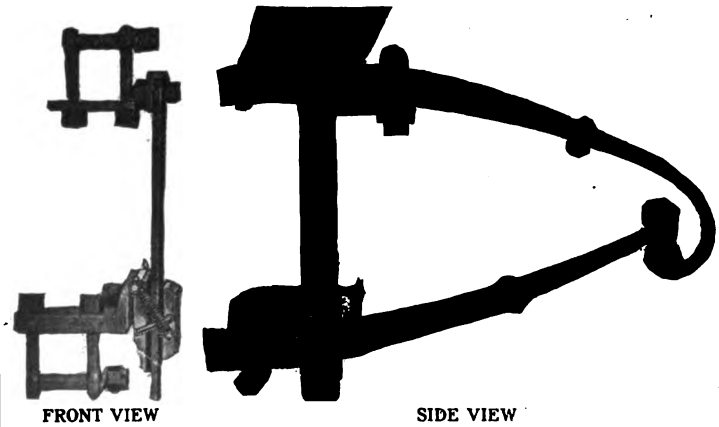
DU PONT FABRIKOID
REG. U. S. PAT. OFF.

MOTOR QUALITY

40% of all the 1915 cars sold were upholstered in this proved, guaranteed material, and in 1916 the total will be nearly 60%.

Fabrikoid is the only standardized automobile upholstery. It wears better than coated splits (commonly sold as "genuine leather") and has the artistic appearance and luxurious comfort of the best leather.

To get the most for your money, buy a standardized car.



DUPONT FABRIKOID COMPANY, - - **Wilmington, Del.**
Factory, Newburgh, New York **Canadian Factory and Office, Toronto**

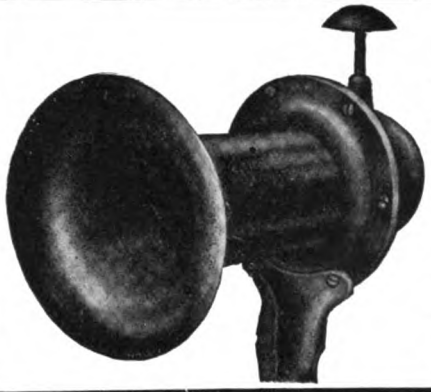
PAINT YOUR OWN CAR—Save $25 to $50

Our big, 36-page book, "THE CAR BEAUTIFUL," is the recognized authority on the Home Painting of Motor Cars. After reading it, you yourself, without previous painting experience, can successfully repaint your car or only revarnish it, or enamel the hood and fenders, enamel or silverplate the lamps, etc., redress the top and cushions, paint the wheels a different color—in fact, do anything you otherwise would have to pay a professional painter big money to do.

During the past eight years, thousands of motorists have successfully painted their own cars with our materials. The Arsenal System of repainting Motor Cars (for novices) is one of the big successes of the industry. DON'T SPEND A CENT FOR PAINTING MATERIALS UNTIL YOU HAVE READ THIS BOOK. Send for your copy today. It is FREE.

ARSENAL VARNISH CO., 2501 4th Ave., Rock Island, Illinois

FRONT VIEW SIDE VIEW



THE car springs with the shock absorber attached are like a compound bow and arrow of great power. When the springs rebound there is a brake on the arrow or rod of the shock absorber, resulting in an easy upward movement. The shock absorber will outlast the car.

Simpler, more reliable than any other, requires no care. Money back guarantee. They are cheaper than car repairs, wear and tear, besides the ease of riding.

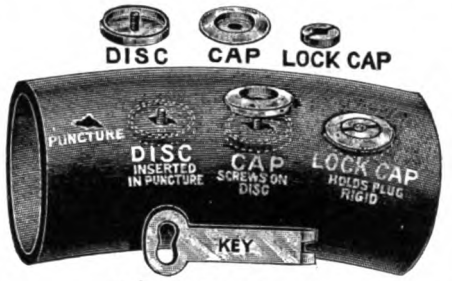
SEND ONLY $2.00 WITH YOUR ORDER and pay the balance when it arrives. ORDER TODAY OR WRITE FOR BOOKLET.

CHICAGO FLEXIBLE SHAFT CO., 620 No. La Salle St., Chicago

SPITLER PUNCTURE PLUGS

The Spitler Puncture Plug repairs punctures in automobile inner tubes quickly and without the use of cement, assuring a safe, permanent and economical repair.



The operation is so simple that a lady can make the repair without soiling her hands.

The plug can easily be taken out and used over again. A permanent repair in one minute.

To insert The Spitler Puncture Plug into the puncture, wet the tube before inserting plug.

Place the base of plug on edge and by stretching the tube at point of puncture, the plug slides in like a button in your coat. Then place cap over discs and screw lock cap firmly.

The Spitler Puncture Plug positively cannot cut the tube nor injure the fabric of the shoe for the principle is the same as the air valve on the tube.

Write for Circular.

Price—Four to a Set, $1.00.

(Patented May 11th, 1915.)

SPITLER PUNCTURE PLUG CO., Inc., United States Rubber Building, 1790 Broadway, NEW YORK CITY

SEBASTIAN LATHES HIGH QUALITY LOW PRICES

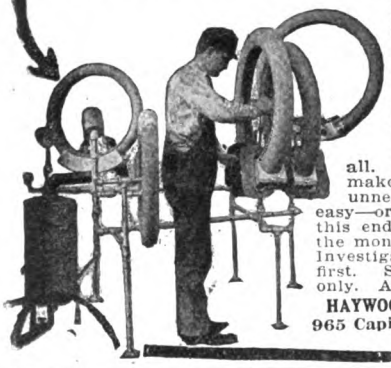
Add $250.00 A MONTH EXTRA To Your Business



REPAIR AUTOMOBILE TIRES

Sounds like a whole lot of money to clear extra every month. Seems almost impossible, but that is what hundreds of men are doing who have added a Tire Repair Department to their business. **The investment is small, the profit large** and **returns quick and all cash**, besides the demand for tire repairing and retreading is constantly growing. Your garage is by no means complete, your business is not as profitable as it can be until you get in on the Tire Repairing and Vulcanizing end.

THE HAYWOOD TIRE REPAIR EQUIPMENT

Answers all the requirements to successfully handle this end of the business. With it and a little business judgment, success is certain. Every year adds thousands of new auto owners. They are looking more and more to economical tire service. The day of discarded tires is over, the Haywood Equipment makes this possible.

HERE IS YOUR OPPORTUNITY

Either as a side line to your present automobile business or as a business by itself, the Haywood Equipment will make money for you. **Tires go wrong all the time.** You know that. Keep them in tune. Give your customers complete service—repair their tires and all. This builds business and makes your rich. Experience unnecessary. You can learn easy—or teach a boy to handle this end. Be the boss and make the money. Learn the details now. Investigate. Act quick. Be the first. Send name and address only. A postal will do.

HAYWOOD TIRE & EQUIPMENT CO.
965 Capitol Ave., Indianapolis, Ind.

PERFECTION Multiple PISTON RINGS

A new type of piston ring that saves power and money

PERFECTION rings are made of 1-16" sections of special soft elastic steel. The openings in the various sections come at different points, causing the ring to always present a barrier to the escape of gas from the firing chamber. Also an equal spring tension at all points gives perfect bearing on cylinder walls. Easily applied, cannot be broken in putting on, cause less friction, save power, reduce carbon and keep down gasoline and repair bills.

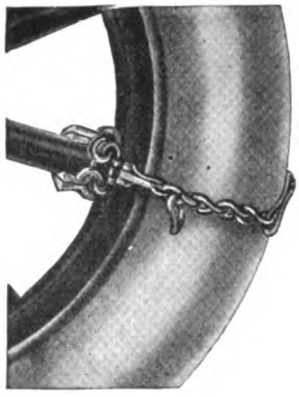
WOODWORTH TROUBLE-PROOF TIRES

Save Trouble and Save Money



Woodworth Trouble-Proof tires are very carefully hand made from the very highest grade material obtainable. They have a puncture-proof leather strip in them which prevents the danger of punctures and on account of the very high quality fabric and rubber used they will average at least 10,000 miles before blowing out. They are guaranteed against both punctures and blow-outs for 5000 miles and are also guaranteed if used on one side of the machine against any other make on the other side, to give longer mileage or a refund will be made.

Think of the satisfaction of having tires that you can feel are absolutely reliable especially when they cost you not more but less than ordinary tires.

Send for TROUBLE SAVERS FOR TIRE USERS, telling about Woodworth Trouble-Proof Tires.

TIMING THE VALVES

For Motors of Varying Speeds and Up to Twelve Cylinders Each.

BY C. P. SHATTUCK, M. E.

NO. 2

In the previous instalment reference was made to the firing order of the engine to be retimed or its valve openings rechecked, and it was stated that a knowledge of the sequence would be of assistance in the work. By this is meant that one will have to rotate the flywheel but half a revolution to check the opening point of each intake valve or two complete revolutions of the flywheel to check the four intakes. This is not absolutely necessary, nor is it imperative that the motorist know the firing order to complete the work. He can check a valve at the time; that is, both the opening and closing points, by continuing to rotate the flywheel until the valve in question opens and closes. This method involves more time and labor but is the more simpler.

Assuming that we are to check the timing of a four-cylinder engine having a firing order of 1-3-4-2. Starting with the No. 1 cylinder (that nearest the radiator) we place the piston at top dead center, then rotate the flywheel in its normal direction until the intake valve starts to lift, which in the case of the timing diagram illustrated at Fig. 5 in the preceding article would be 11 degrees after top dead center. A half revolution of the flywheel or 180 degrees movement will bring the piston of the No. 3 cylinder past top dead center, or in other words, the intake valve of the third cylinder should begin to lift. This completes one revolution of the flywheel. Another half revolution will see the intake stroke of the fourth cylinder in operation, and the fourth half revolution or two complete revolutions of the flywheel will bring the intake valve mechanism of the second cylinder into operation. Similarly, the exhaust valves may be brought into operation. If the firing order be 1-2-4-3, we follow the firing sequence. Four-cylinder motors fire either 1-3-4-2 or 1-2-4-3.

If one does not care to bother with the firing order when checking the timing of the valves the simplest method is to check the openings of each valve in 1, 2, 3, 4 order. With the spark plugs removed rotate the flywheel in its normal direction, which will be anti-clockwise or to the left when looking at it from the rear of the dash, and until the marks I O 1-4 on the periphery of the flywheel register or coincide with the pointer or indicator. Next move the flywheel an inch or so which will cause the valve of either the first or fourth cylinder to lift. Note which valve it is, then move the flywheel back or clockwise until the marks I O 1-4 coincide with the pointer. With the flywheel in this position the valve should begin to lift, and consequently the tappet should be in firm contact with the valve stem. If not, the opening is late and should be corrected.

With the adjustable types of valve tappets it is a simple matter to correct the opening. Loosen the lock nut and rotate the adjusting nut so as to raise the latter which movement will lengthen it. In performing this work it is advisable to use two wrenches, one on the adjusting nut and the other on the lock member, and care must be taken not to exert a bending stress upon the adjusting member. As a rule the locking nut is set up tight and will require some strength to loosen it and because of this fact one must be careful. In adjusting the threaded part of the tappet, turn it up until the valve starts to lift and with the marks on the flywheel registering with the pointer as previously explained. Set up the lock nut so that the threaded member will not move, but not finally as the work should be rechecked. Rotate the flywheel until the No. 4 intake valve starts to open, then with the flywheel marks registering with the pointer, note if this valve opens early or late. If so, correct it by means of the adjusting mechanism. The intake valves of the second and third cylinder can be checked in a similar manner, as can the exhaust valves of each cylinder.

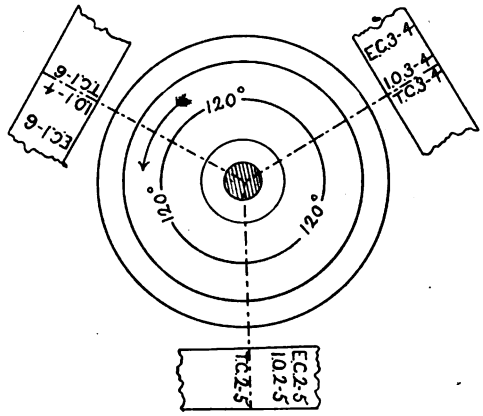

Fig. 6—Illustrating markings of flywheel of six-cylinder engine.

In performing this work one can rock the flywheel back and forth to ascertain the opening point of each valve, and similarly the closing points can be ascertained by utilizing the marks on the flywheel. Generally it will be found that the openings are late. After completing the adjusting of the valves, go over the work once more and note if the openings are correct. If so, set up the locking nut good and tight and be careful that when tightening the locking nut that the threaded member is not moved.

It is surprising the number of owners who readjust the valve mechanism without utilizing the marks on the flywheel and by employing a business card or a sheet of thick paper for determining the proper space between the valve stem and the push-rod. A large number of manufacturers give such directions in their instruction books, but the writer

Digitized by Google

holds that such methods are not productive of the results desired for the simple reason that the thickness of the material used will vary considerably. If fairly accurate results are desired the better method is to use the marks on the flywheel.

Every engine is not provided with adjustable tappet or pushrods and the Ford is an example. When such a condition exists the work of retiming

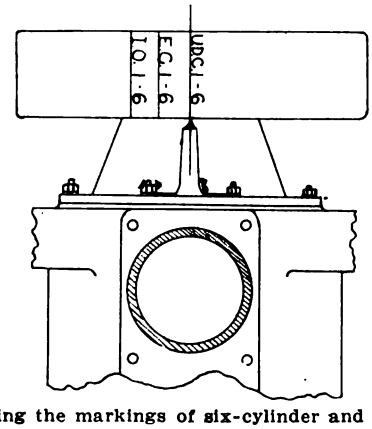

Fig. 7—Showing the markings of six-cylinder and power impulses in degrees.

the valves is more difficult, especially if one undertakes to lengthen the valve stems. The usual procedure is to draw the temper of the valve stem end, then lengthen it by hammering, and file to obtain the desired length and proper lift. After this work, which will take considerable time, the end of the stem should be hardened. The better and more simpler method is to purchase the valve stem adjusters marketed for the Ford. These consist of a cap-like member which fits over the valve stem, and a number of discs of varying thicknesses are provided for compensating for wear of the stem. As the flywheel of the Ford motor is not readily accessible and is not marked as is the conventional type, the clearance between the pushrod and valve stem is determined by measuring. The space should not be greater than 1/32-inch nor less than 1/64. If too large a space exist, the valve will open late and close early. If too small, there is opportunity of

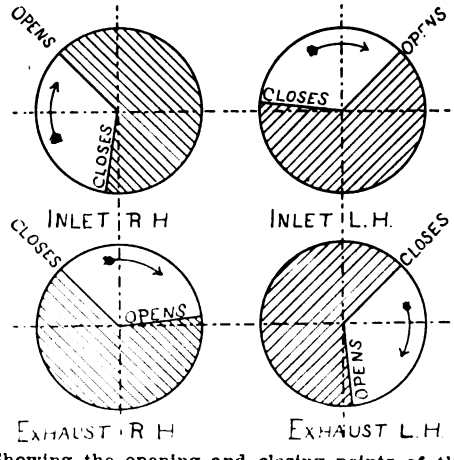

Fig. 8—Showing the opening and closing points of the valves of an eight-cylinder power plant.

the valve not closing when the engine is hot. This brings up a point that the amateur repairman should not overlook and that is the necessity for making allowance for the expansion and contraction of metal when hot and cold. Where an adjustment of the valve mechanism results in a very small space between the tappet and the stem, and with the motor cold, one must allow for expansion. Consequently, the better way in making adjustments of a close nature is to perform the work when the engine is warm.

The flywheel markings of a six-cylinder engine are shown in Figs. 6 and 7, the latter diagram illustrating that the strokes are the same as in a four-cylinder engine and that the impulses occur every 120 degrees instead of 180 as with the four-cylinder power plant. By this it will be seen that the power strokes overlap and this should be taken into consideration when rotating the flywheel and checking up the valve timing. The method of correcting the opening and closing points is the same as with the four-cylinder engine in so far as the mechanical work is concerned.

To decrease or increase the clearance between the valve stem and adjusting screw in the valve mechanism of the eight-cylinder engine one proceeds in the same manner as with the four and the six, but unlike these the power strokes are four in number, of 135 degrees duration during every revolution, as against three in the six and two in the four. In the King eight-cylinder engine, for example, which has a stroke of five inches, the power stroke is not com-

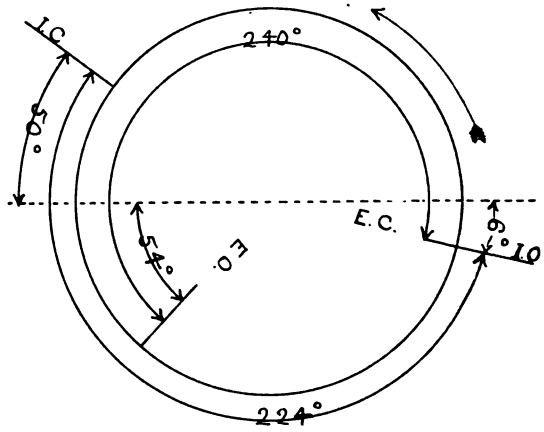

Fig. 9—Timing diagram of twelve-cylinder engine.

pleted within 45 degrees crankshaft travel which is equivalent to 1⅝ inches of piston travel when the next cylinder fires. The piston travel of 1⅝ inches is the overlap of one explosion with the next, and each power stroke is overlapped by that of the next cylinder in the firing sequence by 45 degrees.

In adjusting or retiming of the valves of the Cadillac eight, type 53, it is necessary to have the cams in a certain position which is obtained by rotating the flywheel until the valve in question has just seated. The flywheel is then further moved to a distance of 1⅝ inches of its periphery when the clearance should be between .002 to .003-inch and with the engine cold. The inlet valves of this engine open and the exhausts close on dead center, and the intakes close 46°-40′ after low dead center and the exhausts open 46°-40′ before center. The opening and closing points are diagrammatically illustrated at Fig. 8. The marks of the flywheel can be employed as with the King engine. The retiming of this motor is simple even should the silent chain driving the camshaft be displaced as the sprockets are marked, a tooth of the crankshaft meshing between two teeth of the camshaft sprocket.

Figs. 9 and 10 show the valve timing diagram of the National and Pathfinder twelve engines and are of interest in that they show the duration of the

Digitized by Google

power strokes in degrees, also how the strokes overlap.

While it is a simple matter to retime a motor when the flywheel is marked, the work is more difficult without the markings. One can generally obtain the timing diagram from the factory and with it you first proceed to lay off the periphery or rim of the flywheel in degrees. Spaces of two degrees will

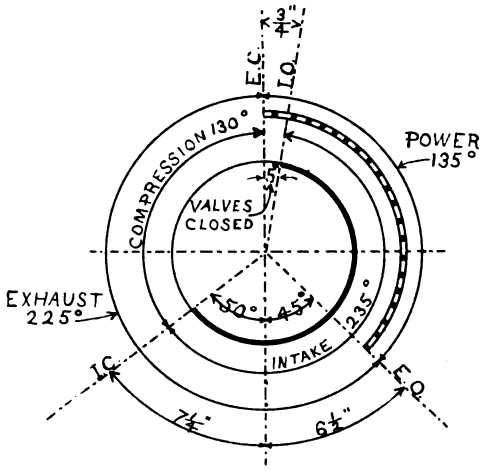

Fig. 10—Showing the power stroke of the twelve-cylinder engine, also opening and closing points of valves.

suffice for large flywheels and four degrees for a small one of 14 inches in diameter for example. The proper spaces between the marks are found as follows: Multiply the diameter of the flywheel in inches by 3.1416 and divide by 180 for two degree spaces and 90 for four degree spaces. There are 360 degrees to the circle.

A simple method is to take a piece of stiff paper of the same width as the rim of the flywheel, and in length equal to the diameter multiplied by 3.1416. Divide and mark the paper into four 90 degree spaces, or two 180 degree, and fasten the paper to the flywheel by means of paste or glue. Next we obtain the top and bottom dead center lines, and by means of a plumb line used as shown at Fig. 10, we obtain these positions with the crankthrows in a vertical position. Where the line touches the top and bottom of the flywheel will be the dead centers for the crankthrows of cylinders 1 and 4, and 2 and 3. This is simple, as two crankthrows will be up and two down with the four-cylinder engine. Mention is not made of the six-cylinder as the flywheels of these are marked. As a rule unmarked flywheels will be found with very old engines.

To lay off the degrees on the flywheel the latter and crankshaft are sometimes mounted in the lathe and a square or spirit level utilized to ascertain the centers. It is possible to lay off the degrees with the lathe. Having ascertained the dead center marks the next step is to prick punch the cylinder or crankcase which marking will serve as an indicator or pointer.

Having obtained the dead centers mark the paper, starting with 360 for the top dead center of the crankthrows 1 and 4, and 180 for the centers of 2 and 3. Next mark or lay off in 30 degree spaces, beginning with 360 and in a direction opposite to that in which the flywheel revolves. If desired the spaces can be laid off in 15 degrees or even finer still, in two degrees by dividing a space of 30 degrees as indicated in the sketch at Fig. 11. This will enable one to time within very close limits. Having laid off the flywheel, it is an easy matter to mark it according to the timing diagram. The directions will be of value should it be necessary to replace a broken timing gear and when the original markings are destroyed.

When the timing is not known, one will have to experiment more or less. For small and high speed engines set the intake to open from 12 to 15 degrees after top dead center and close from 25 to 30 degrees after lower dead center. Set the exhaust to open 40 degrees before lower dead center and to close 5 degrees after top dead center. With large and slow speed engines the intake should open from 5 to 10 degrees after top dead center and close from 15 to 20 degrees after lower dead center. The exhaust should be open from 30 to 40 degrees before lower dead center and close from 0 to 5 degrees after top dead center. Medium speed engines have a setting between these two, and the timing given is general not specific. In experimenting with valve setting it should be borne in mind that advancing or retarding the camshaft gear by a single tooth may make a difference of 10 degrees on the flywheel. This, however, may be determined when laying off the wheel in degrees. It is not practical to alter the manufacturer's setting without introducing new defects, and any change should not be made without the advice of the maker.

The correct functioning of the valves is important in that fuel economy is obtained to say nothing of a sweeter running engine. After restoring the valve mechanism to an efficient condition one should go a step further and overhaul the ignition system for a good spark is essential if the maximum amount of mixture is to be burned. Old wires should be replaced with new to prevent leakage of current, particularly those conveying the intensified electricity, and the breaker mechanism of the primary circuit

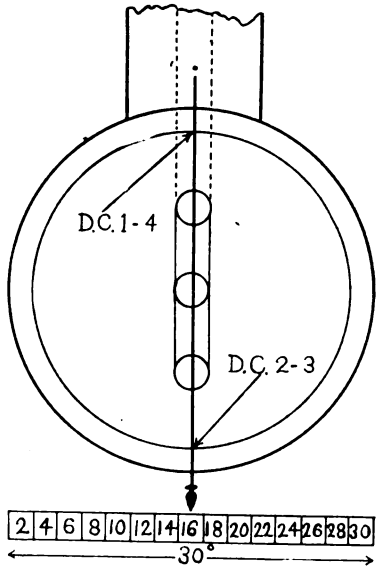

Fig. 11—Illustrating how to obtain dead centres on unmarked flywheel and how to lay it off in spaces of two and four degrees.

be adjusted according to the instructions of the manufacturer. Relative to reducing the cost of operation, one should learn to properly adjust the carburetor. Use as lean a mixture as possible to save fuel, and if it is productive of hard starting, look elsewhere for the cause and remedy it. By observing these precautions the motorist will find that the mileage to a gallon of fuel will be considerably increased.

FORD SPARK PLUG TROUBLES.

What Causes Some of them and How they May Be Remedied.

From Murray Fahnestock, Pennsylvania.—Trouble with oily spark plugs almost invariably occurs at the first cylinder, because the oil feed pipe delivers all the oil to the front cylinder. If this trouble occurs, it is a sign that the oil level is too high or that the piston and rings are not a good fit in the cylinders.

The oil level should never be higher than the upper petcock in the crankcase, and a good quality of oil should be used. Some owners drill a small hole in the oil feed pipe, opposite the second cylinder. This diverts some of the oil and prevents the flooding of the front cylinder. However, this hole should be rather small, or the timing gears and front cylinder may not receive a sufficient supply of oil.

When the Ford car is standing on a level floor, the rear of the crankcase is intended to be about half an inch lower than the front of the crankcase, so that the oil will flow freely from the front of the crankcase, where it enters, back to the sump below the fly-wheel. If the front spring is sagged, it should be replaced or retempered. A pad or block can be placed between the spring and the cross member of the frame to bring the motor up to the proper level. The fitting of shock absorbers to a car sometimes raises the car more at the rear than at the front, and this point should be carefully noticed. As the Ford runabout has the same rear spring as the touring car, but does not carry nearly as much weight at the rear, the spring of the runabout has a tendency to hold the rear higher than it should. This condition is best remedied by removing one or more leaves from the rear spring, which will also make the car ride easier.

Scored cylinders will sometimes allow oil to work up past the pistons and into the combustion space where it will cause trouble. If the cylinder walls are badly scored, it will be necessary to have the cylinder block rebored. If the cylinder block is sent to the factory, or to one of the branches of the Ford Motor Company, they will rebore the cylinder block for two dollars. A set of oversize pistons, with rings and pins, complete, will cost six dollars.

The new pistons will be one-thirty-second of an inch larger than the old ones, and the increased power will amount to the difference in area of the two circles. Carefully figured, this amounts to somewhat less than half a horsepower, an amount that would not be noticeable in the running of the car. In practice, however, a substantial power increase often results. This is due to the fact that the cylinder block has been subjected to numerous heatings and coolings since it was first placed in service and the iron has aged. The cylinder bores may have warped slightly out of round and, when they are rebored, they are made straight, and remain true, because the iron has already attained its permanent set. When the bore of the cylinders is true, the compression does not escape easily and the motor has much more power. After the motor has been rebored and new piston fitted, plenty of oil should be used and the motor run carefully for the first few hundred miles, until the parts have had a chance to wear to a perfect fit.

Sometimes the pistons become worn, and this can generally be remedied by replacing the pistons with new ones or by installing pistons that are .0025 inch oversize.

The proper clearance between the pistons and the cylinders is between .003 and .006 of an inch. This distance can be measured by the use of a thickness gauge or feeler. Sometimes the lower part of the piston is drilled to let the oil drain back into the crankcase but the method does not seem to do much good in actual practice. If one piston is drilled, the rest should be drilled also, or the motor will be thrown badly out of balance and vibration and loss of power will result. In this connection, it is well to compare the weight of the oversize piston with the other pistons, if only one large piston is fitted, as they should all be of the same weight.

If the top edge of the piston is rounded, it will not have as much tendency to scrape the oil off the sides of the cylinder walls and carry it up into the cylinders. This same idea can be applied to the piston rings, the top edges of which can be slightly rounded to advantage. Well fitted piston rings are one of the most important means of preventing the flooding of the cylinders with oil. The rings should not only fit closely against the cylinder walls but the edges of the rings should be a good fit in the grooves of the pistons. The gap between the ends of the piston rings should not be over three-hundredths of an inch, when the rings are in the cylinders. These gaps should not be in the same straight line for the three rings, but should be spaced equi-distant around the piston, thus giving the escaping gases the longest possible path to travel.

If the carburetor is adjusted to give too rich a mixture, it will cause sooting, and short-circuit the spark plugs. Then, of course, oil will rapidly collect in the cylinders, because it will not be forced downward by the explosions.

Misfiring due to other causes, such as a worn or oily commutator, vibrators out of adjustment, or weak magnets, may cause the spark plug points to become clogged with oil, because the oil will not be burned as it is drawn up into the combustion space.

Some owners make a practice of coasting down hill, with the clutch engaged and the spark shut off. Under these conditions, a partial vacuum is formed in the cylinders, especially if the throttle is kept closed, because the air is pumped out through the exhaust. This tends to draw the oil into the cylinders and foul the spark plugs.

It is important to have the points of the spark plugs the proper distance apart, which is about 1-32 inch, or about the thickness of a worn dime. It is also well to bend the side electrode upward, so that the oil will drain off to one side and not collect between the points of the spark plugs and cause trouble.

Bosch Plugs For Battery Ignition.

In the December issue it was stated in the Trouble Department that "Bosch spark plugs are designed for magneto ignition." This of course is true, but they are designed also for battery ignition, and it is claimed that they will last even longer on cars using battery ignition systems, inasmuch as they are made primarily to withstand the intense heat of the magneto spark.

No part of the car is more responsible for your safety than the steering gear and steering connections.

ADJUSTABLE SPRINGS

So That They Will Always Be Correct in Proportion to the Load.

From Henry Sturmley in The Motor, London.—I have on more than one occasion suggested the desirability of some better system of springing cars than we have at present, pointing out that, to obtain perfect springing, the springs should be exactly proportionate to the load, and that, as the load varies, the spring system on any particular car can only be just right for one specific load, so that, when either more heavily or more lightly loaded than the exact weight for which the springs are designed, the springing will be inaccurate and the riding consequently less smooth and satisfactory than it should be.

Some designers, in working out the proportions of their springs, aim at hitting a happy medium as a rule; but others spring the chassis for the heaviest

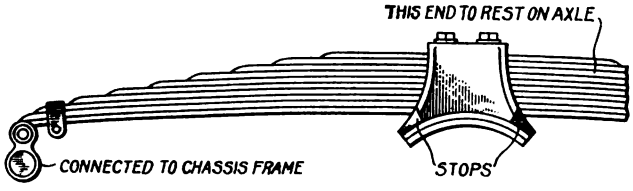

Fig. 1—Spring and Quadrant.

load the car is constructed to carry, so that, for example, if a car is fitted with a five-seated body, the chassis will be sprung on the assumption that it will be loaded when is use with the particular body for which the springing is designed, plus five people of average weight, so that, when less than the full seating capacity of the car is occupied, the riding will be more or less harsh. This, of course, will be accentuated where the possible range of load is greater, as, for example, in a seven-seated car, or in an ambulance arranged to carry six, but which, on the other hand, is made only at times to carry two, and, of course, in this latter connection it is of the highest importance that the springing should be as easy as possible for however many or few cases there may be on board.

Where commercial vehicles are concerned, the need for adjustable or adaptable springing becomes greater still, as the difference between the load upon the springs in, say, a three-ton chassis when fully loaded and when travelling empty is very great. But we need not trouble ourselves at the moment with commercial vehicles. The highest efficiency of springing is desired for the comfort of the passengers, and not only the load, but the nature of road and average travelling speed, will also be points which will more or less affect the result attained by our springing, so that all these factors have to be considered before we can hope to get perfection.

It will be seen, therefore, that perfection cannot be obtained from any non-adaptable system, and that the best we can do with such is to arrive at a compromise. Hence it was with a considerable amount of interest that I heard some little time ago of a new idea in the direction of an adjusting spring system, and I am pleased to be able to give details of this device, which is now being applied with considerable success in practice.

The system is really extremely simple. The efficiency of a spring depends very largely upon its length between unsupported points, and the method of securing adjustability is to vary the length between the supports, thus giving a greater or less length for free play as the occasion may require. For this purpose, the inventor adopts the cantilever form of springing, which consists of a long but slightly arched spring resting on the axle at one end and supported on the frame both at its center and at the forward end, which, being shackled, can accommodate itself to the variations in length caused by spring flection under load. Whilst, therefore, the center and forward end of the spring are both attached to the chassis, the tail extremity rests only upon the axle, and this end partakes of the fullest movement under the undulatory action of the wheels in travel. The new plan varies the length of this free rear end, or, rather, he varies the position of the point of central support, as will be seen by the annexed illustrations. As shown, the central attachment of the spring to the frame consists of a box containing the center of the spring plates, which, instead of being bolted direct to the side of the chassis frame as usual, rests upon a support carried free of the frame, but resting upon a bearing rotatably mounted upon the end of a tube running across the chassis below the frame and supported by brackets depending from it. The under portion of the spring box is arched to correspond with the arc described by the supporting bracket around its center of movement on the supporting tube end, the base being so shaped as to engage with suitably shaped guides in the side blocks, which serve to connect it with the rotatable bracket in such a way that the movement of these sides is limited by stops and so prevented from leaving the spring box altogether.

Now it will be seen that if this movable bracket, which may be set at any point between its limits of movements, is set in a central or vertical position, the effect upon the spring will be the same as with

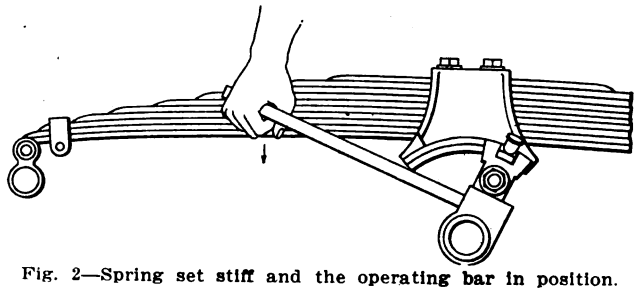

Fig. 2—Spring set stiff and the operating bar in position.

an ordinary cantilever spring supported to the frame sides at its central point, and, so set, the springing may be termed normal. For heavier or lighter loads, the rotatable supporting bracket is moved around its support either towards the front or rear end of the spring box as may be required, this movement being effected, after the loosening of a nut, by a lever inserted in a socket in the bracket, as shown in the illustration. With the leverage for this purpose, this is not a difficult matter, and the adjusting lever is arranged to be carried by spring clips on the inside of the chassis frame, so that it is always handy. It will thus be seen that, when the bracket is moved to a rearward position, the length of the free end of the spring is shortened, which results in making the spring stiffer; whilst, when moved in the other direction, the center of support being further forward, the free length of the spring end is increased, giving

Digitized by Google

greater play and more flexibility. Mr. North, in his spring, dispenses with the usual shackle at the front end of the spring, and anchors this end firmly there, if it is intended to take the driving and braking stresses through the springs; but where a separate torque system is provided, a shackle is used for the attachment of the spring to the rear axle.

As the springs are designed, the ratios of maximum to minimum stiffness is 1.55 to 1, so that, roughly speaking, with the point of support shifted

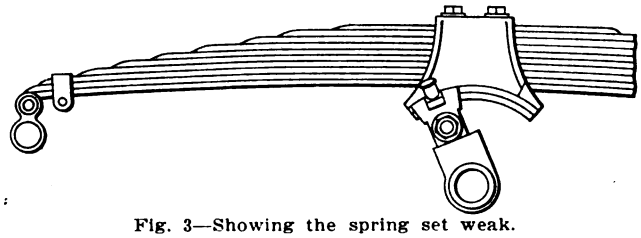

Fig. 3—Showing the spring set weak.

to its rearmost position, the spring is half as stiff again as when the foremost point of support is employed. This certainly appears, as I have already said, to carry out the idea of adjustability in an extremely simple as well as a most efficient manner, and it will be interesting to note how this new advantage provided for the user for the increase of his comfort is accepted by trade and public. To me, the idea appears to be an excellent one and worth the careful consideration of designers generally.

REPAIR ACCOUNTS.

A Simple System That Will Answer For Small Garages or Shops.

That a repair shop and garage accounting system is of value in that it enables the owner to practically eliminate leaks, is acknowledged by those familiar with the work of caring for motor vehicles. There are many systems exploited but the majority as a rule, are not adaptable to the small shop owing to the numerous details involved. And it has been truly said that one can easily overdo the systematizing of his business, and in the endeavor to see that each detail is carried out, one may neglect the customer. Comprehensive systems are not suited to the small garage because their maintenance necessarily entails expense and time. The practical system for the small garage is one that will afford a record of all work done as well as one of supplies, material, stock, etc.

For a shop of small proportions the system described herein will prove of value. It can be altered to meet individual requirements and added to for larger shops. The cost of the tags, slips and books is not unreasonable, and some of the forms may be purchased ready made and a serial number printed. As previously stated, a simple system should be one that does not require a large number of slips and the tags utilized should be made of sturdy material for the average workman is not qualified to handle ordinary paper. For this reason manila shipping tags with serviceable string are recommended.

If the garage be so located that it caters to transient trade the manila tag, shown at Fig. 1, which is about six by three inches, will be of value for a number of reasons. As may be noted the tag is perforated, is made in three sections, and that both the upper and lower parts bear the name of the company. Assuming that the car enters the garage and its owner states he may leave it for a few hours or more. The attendant takes a tag from the rack, enters the time of arrival, name of owner, address, make of car, license number, supplies desired, etc. The lower section of the tag is torn off and given to the owner. His attention is directed to the notice that the company is not responsible for articles left in the machine, and if he desires to avail himself of the free checking privilege, the articles in the car are checked up and taken to the check room. The owner is given the lower half of the tag shown at Fig. 2. He must present the check to obtain the goods. The upper half of the tag is placed with the articles in the check room.

Referring to the tag at Fig. 1 once more. After the floor attendant has filled in the tag, the upper section is tied to the steering wheel and the middle section turned in at the office. This gives the office a record of the storage, car, etc., and prevents any attendant from pocketing the charges as is possible when a car is left late at night and taken out before the arrival of the proprietor of the garage. It also provides the garageman with a record of the revenue derived from transient trade, and the address of the transient, if local, is also of value.

When the transient calls for his car, the time stored is easily figured as are the charges. Should the customer desire his machine sent to the hotel, for example, it is not surrendered until the owner's tag is given up. This prevents use of the machine by others than those intended. After the car has left the garage the top section of the tag is turned

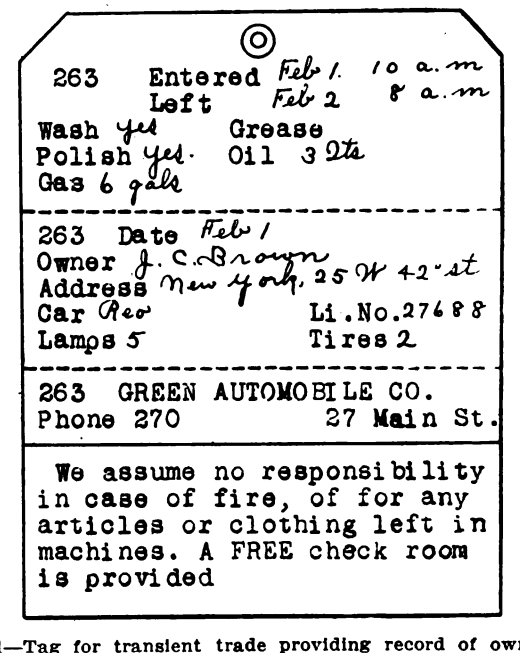

Fig. 1—Tag for transient trade providing record of owner, car and equipment, also section presented by motorist when receiving machine.

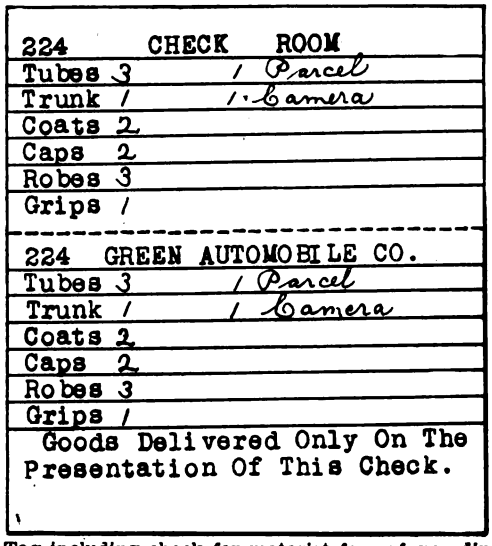

in at the office. If a chauffeur brings in the car and desires a receipted bill, one can be quickly made out. The tag also affords means for keeping track of the oil and gasoline sold.

Coming next to repairs which are often disputed by the customer. The records for repair work should be accurate and so kept that the customer won't have a leg to stand on should he attempt to dispute any item of the work. On the other hand, the proprietor of the shop should know whether his repair shop is being operated efficiently and if there

Digitized by Google

is a loss or a profit on the work, and if the profits are proportionate to the capital invested. If two or three workmen are employed one wants to know who the shirkers are, and if the men who have been with the shop but a few months, which one is best adapted to a certain line of work, etc. A record is not possible unless some method is employed to keep track of each man during each day and on varying jobs.

We will assume that Mr. Smith drives in, calls for the proprietor and explains that certain work

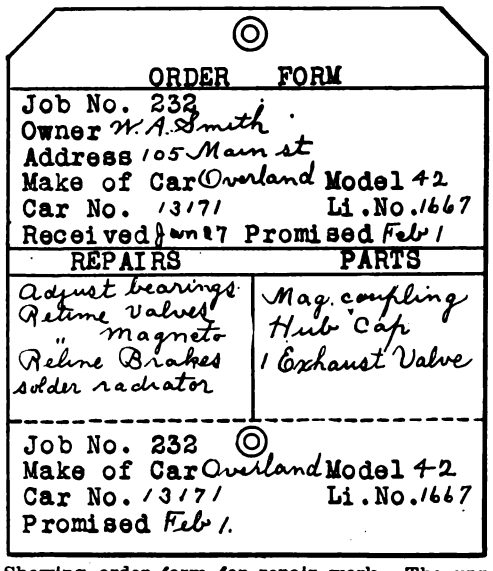
Fig. 2—Tag including check for motorist for safeguarding articles left in the machine. The articles are removed and placed in the check room.

is wanted. The order form shown at Fig. 3 is utilized, it consisting of a perforated manila card about six by four inches or any standard size. Each card bears a serial number, and both upper and lower parts are filled in as shown. This gives a complete record of the car, work to be done, when promised, etc. The upper section of the card is turned in at the office but not before the lower part, which also bears a serial number, is attached to the car. The check tag, shown at Fig. 2 can be utilized to check up the articles in the car and its equipment. The motorist is given the lower half of the tag. This prevents any claim being made for articles or equipment not in the car and avoids the possibility of error as the articles are checked when the car is delivered to the customer.



We will assume that the shop be not equipped with a foreman and that the owner supervises the repair shop. A list of the jobs with their serial numbers is kept in the office and the date they are promised. In connection with this should be mentioned that one should be careful in promising work. However, one should be able to give an approximate time if familiar with the repair end.

The lower half of the tag shown at Fig. 3 with a memoranda of the work to be done, is kept in the office, and when a workman is to start on the job, or the work can be assigned by the proprietor, the tag bearing the job number and slip is handed the workman. The latter proceeds to take an employee's card from the box in the shop and as may be noted these cards are daily affairs and are filled out as shown at Fig. 4, the data including the employee's name, time he started to take out the card, time of start and finish of the work and its nature. If the workman be called off to make an adjustment on another car, he marks the time he left the first job, and takes out a new daily card. The proprietor must, of course, fill out the card shown at Fig. 3 else he would not have a record of the work. This i imperative if the owner of the shop would keep a record of all work done, and the tags should be used for cash as well as charge jobs. When the workman finishes the adjustment, he marks the time on the card and turns it in at the office, then goes back to the original job, marking the time he starts and finishes. At night the cards are turned in at the office enabling the proprietor or bookkeeper to enter the jobs on the ledger.

Fig. 5 represents the reverse side of the card at Fig. 4 and on the former is entered the material, supplies, stock, machine work, etc., used each day. These items are also entered on the ledger. Upon the completion of the work the bill can be made out. If one desires to utilize a loose leaf system, the accounts can be made out in duplicate and the copies sent to the motorist. When the account is paid entry is made on the day book and the copy receipted. After the account is closed the leaves are removed from the binder and filed in alphabetical order.

If the customer pays cash, an entry is made in the cash book shown at Fig. 7, and the entry includes the dates, customer's name and amounts received, each in the debit column, or under the designation of debits. The expenditures are entered in the credit column, or under the designation of credits. From this book the debits and credits are made to each account. The difference between the columns of the cash book, added to or deducted from the bank balance, will give the amount of cash on hand.

There are various systems for keeping track of the gasoline. One of the simplest is to charge under

time. By utilizing a memoranda card on which the workman may enter his requirements, material can be kept stocked. In the small garage the proprietor usually supervises the stock but it can be left to one of the older and more experienced workmen if desired.

A good temporary repair of a gasoline leak may be made by covering the opening with a bunch of hard soap and wrapping with tire tape.

OVERHAULING THE CAR

When and How It May Best Be Done for Both Owner and Repair Man.

From J. N. Bagley, Nebraska.—The time of year the run-down car should be repaired and put in good condition is during the winter months when business is slack, but this fact is often overlooked by the user as well as the repairman. When the weather and roads are in bad condition, the repairman should look up these jobs and keep busy during the winter months instead of waiting for it all to come in a bunch. The overhauling usually begins in earnest about the first of April, consequently the repairman is overrun with work and every one wants his job first. Yet, when the repairman's business is slow he can do a better job for less money than he can when there is a hustle and bustle of business and he ought to impress this fact on his customers.

A car should be overhauled at least once a year, and minor things should be looked over at more frequent intervals. Occasionally the motor should be tested for compression, the plugs should be cleaned, the wiring should be examined, the gas tank should be drained, the brakes should be tightened and inspected, the magneto should be readjusted and cleaned, springs oiled, etc. This does not come under the head of overhauling, but such attention is frequently demanded.

In case it is deemed necessary to completely overhaul a car, every part should be removed and examined and all worn or broken parts replaced with new. When this is done in a workmanlike manner, the old car will go out and do eighty per cent. or more of the work it would when new.

Before dismantling a car it should be taken to the wash racks and all dirt and grease removed, as no workman can otherwise do a good job upon it. After a bath it should be taken to the work shop and the body removed, so that the chassis and accessories are easily accessible. Before proceeding further it is a good plan to get a number of good, strong boxes to place the various parts in, so that each part may easily be found in reassembling. Place all the engine parts in a box by themselves. The transmission bolts likewise may be thus disposed of, as they belong to the rear assembly. After all the bolts and other parts are free, give them a bath in gasoline, leaving them clean and bright and free from grease.

Now begin by inspecting the different parts of the engine to note if any need to be replaced with new and if so make a list of them. Pass to the transmission and do likewise, finishing up with the axle. The crank case can then be cleaned up and the main bearings adjusted. To do this remove everything from the shaft and place it into the case and adjust one bearing until it is working a fit; that is, a fit that will allow free and easy turning with the hands, being careful to note if the shafts bear evenly on all parts of the box. Now that the first is fitted, take the second bearing and proceed in the same manner and so on until all have been taken up. Now tighten all of them down and note the manner which the shaft turns in the bearings. It should now turn stiff as all of the main bearings are tight. Then fit each of the connecting rods to the bearing at the crank shaft until the weight of the piston will just slowly drag them down with the bearing on the shaft, all points. After all of the rods have been fitted and

Digitized by Google

the crosshead pins made good, secure all rods to the shaft and key bolts as well as main bearing bolts.

Next examine the rings and note their condition. Many times they look good when as a matter of fact they are in poor condition. If they fit the grooves in the head perfectly, remove one of the rings, place it inside the cylinder and note the gap between the ends of the rings. If they fit close together when the ring is compressed in the cylinder walls they are all right, but in case the space between the ends is unusually large the ring should be removed and replaced by a new one. The valves in the cylinders should next be examined and in case the seats are pitted or irregular they should be ground in and all the carbon deposit scraped from them. Also note if the stems fit snugly in the guides, for if they are loose enough to allow a quantity of air to be drawn in around the intake valve when the charge of gas is drawn from the carburetor, it will be impossible to adjust the carburetor so the engine will work well at a low throttle. In case the stems are worn so they do not fit the guides, they should be replaced with new ones that do.

We are now ready to replace the cylinders and bolt them fast to the case, but before doing this note if the gaskets on which they rest are in good condition, and if not, cut new ones of heavy hard paper and use plenty of shellac. Next cut the gasket for the oil pan and place it in position and bolt it tight, as a leak of cylinder oil should not come at the joints. Examine the gears in the front of the case and note if they are worn sufficiently to allow of a slap, as the cam shaft is revolved against the spring pressure from the valve springs. In case the gears are worn sufficient to make a noise, nothing can be done, except to replace with new, as a repair is not possible.

Go over the magneto and replace such parts as are worn and thoroughly clean it with gasoline. In case the points are worn or pitted, they should be replaced or dressed until they fit square and firm. See that the little roller in the breaker bar does not have quite a little play on the shaft, as some missing comes from this particular trouble. Have the points adjusted as recommended by the makers of the magneto, as all do not require the same adjustment. Examine the coupling between the magneto and the gear and note if there is a slack, so that the armature can be moved back and forth a little distance, as this should not be. Be absolutely sure that the magneto lines up so the drive is straight through, or the bearings will be ruined or damaged in a short time. Most magnetos are fitted to a bracket in such manner that they cannot get out of adjustment, while a few have shims which permit of them being shifted about and in the case of the latter it should be looked to carefully.

Examine the pump, especially the stuffing nuts at the ends, and note the condition of the packing. If hard and dry it should be replaced with new and oil or graphite used. Do not screw it unnecessarily tight for holding the water. The hose connection should be replaced with new in case the old is not good. In replacing hose, especially if a trifle tight, it is a very good plan to cover the inner surface with hard oil, as it will thus slip to place without any unnecessary forcing.

The radiator should be washed out thoroughly and if possible use water from a hose, allowing it to flow through for some little time. A sediment will collect in a radiator that affects the circulation and during cold weather will cause some of the tubes to freeze and break open.

All bolts holding the motor in the frame should be replaced with new in case they are worn enough to allow the motor to move about during use. The cross member at the front of the frame should be examined and the condition of the rivets noted. If the rivets are found loose, cut them out and replace with new ones put in hot, as it is impossible to use old rivets to any advantage. When the motor has reached the stage where it is ready to set into the frame, it is a good plan to apply a good engine paint to the cylinders, as well as a coat of aluminum paint to the case and minor parts, such as manifolds, etc. This does not add to the efficiency of the motor but improves its appearance wonderfully and the customer will be more than pleased with the little time and paint taken to do the work. The motor can be left until the balance of the car is ready to assemble or it can be placed in the frame.

Next in order will be the clutch, which should be examined closely. In case of a leather faced clutch the leather if found hard should be replaced with a new one. In replacing the new leather, it should be soaked in warm water until it is pliable. When it dries it will be tight and smooth. The rivets used should be soft copper and the heads peened down below the surface sufficiently to not bear on the metal as the clutch is let in. In case the clutch is of the multiple disc type the disc should be taken out and each one examined and those found rough or cut should be discarded and new ones placed in their stead. The multiple disc should only be adjusted tight enough to prevent slipping, as nothing is gained by having the tension spring over tight. The releasing yoke should be examined and in case of wear it should be replaced, as a partly released clutch makes gear changing very difficult as well as dangerous to the gears.

The differential gears should be examined as well as the spider which supports them. In case they have play on the spider a new spider should be used as a little slack in the rear assembly only adds to danger of some other part of the car. The key and key seat in the bulb, as well as in the axle, should be examined and if any plays found, a new key should be made that fits tight. The mesh of the gears should be examined and in case they do not fit perfectly, the proper adjustment should be made before assembling. In case there are metal thrust washers, they should be replaced with new washers, thus giving the gears the proper mesh.

The brake shoes should be removed and the condition of the lining noted and whether or not the copper rivets holding it to the metal are bearing on the brake drums and cutting or roughing it sufficiently to damage the lining. The rivet heads should be sunk below the surface to prevent bearing on the metal drum as the lining is worn down. In case the break lining is hard and full of grease and dirt, it is not advisable to try cleaning, as new lining is the only safe repair when the responsibility of a good brake is considered.

The springs should be taken apart and all rust removed and flake graphite placed between the leaves. Oil will answer the purpose in a way but it has a tendency to collect dust. The spring shackles should be taken apart and the oil channels opened up and in case they do not fit the loop ends of the springs, they should be replaced with new, or the

Digitized by Google

bushings in the springs should be replaced to effect a fit on the bolt. The springs should not allow the frame to swing sidewise if they are held secure at the ends by the shackle and shackle bolts. These bolts should have a small hard oiler in each of them and these should be the kind that the lubricant will be forced into the bearing, as oil will not always flow as it should, especially in cold weather.

All wiring about the car should be examined to see that it is not worn through and resting on the metal. Many times a skinned wire gives all sorts of trouble and while free access to all parts can be had, is a very good time to replace defective wiring.

Jack up the car and note the condition of the wheels and bearings. Clean the bearings with gasoline and supply a fresh lubricant. Revolve the wheels and note if they run true. Grip the wheel firmly and try it for side play in the bearings, as a front wheel loose on bearings is only a trouble added to the steering. The steering gear should now be gone over carefully, as well as those joints and rods which connect it to the wheels. In case the gear has slack within itself, the worm or sector is very likely worn and if it is not supplied with the necessary adjustment, new parts should be placed until it moves free but firm.

In assembling the parts of the car never neglect so little things as a cotter key, for when the customer inspects the job he will notice these little things a great deal quicker than he would if the radiator had been left off, and in mentioning the job to his neighbor, he will never forget to tell him the best place to take his car. Never overlook the painting of the engine, as nearly every man will notice that the instant he raises the hood, and these little things go a great way toward having a large list of satisfied customers. The writer knew of a man who went to the city to buy a car. They told him they had a car that had been driven by a doctor, and he passed to the better world and could not ship the car there, so his widow wanted to sell it at a great sacrifice. He bought the car at the figures asked, because it had been repainted and looked well, but as a matter of fact he had nothing when he got home but a worn out car. Appearance goes a great way, and the time spent in giving the car the appearance after the overhauling is done, is time well spent, even though you do not charge the customer a cent.

Taking next the transmission, it should be gone over carefully and all gears which are jammed at the teeth should be replaced with new. The bearings should be tight so that the gears will not ride each other. The shift bars should be adjusted so that when the lever stands in position the gears will mesh full and square. The end slack of the transmission shafts should be removed, so that when the gears are shifted, they will not have a tendency to crawl past each other, thus allowing only a part of the gear to take the load. The holes in the supports of the transmission case should be examined to see whether or not the case has been working on the frame during service, and in case the holes are worn oblong they should be drilled out as well as the holes in the frame, and new bolts made to take the place of the old ones. The universal joint at the back end of the transmission should be examined and all the old oil or grease removed. Worn parts must be replaced with new after which a sufficient quantity of good, hard oil should be used.

The back axle assembly should be taken down and all bearings examined as well as those parts working in the bearings. Note if the bevel ring is working on the differential case, and in case it is the rivets or bolts must be removed and new ones used.

THROWING BOUQUETS.

Likewise Information About Vibration, Balancing, Second-Hand Cars and Straining Gasoline.

BY JAMES F. HOBART, M. E.

The writer recently received a letter from a gentleman in the Middle West—Mr. Fred Schuman, Iowa—who passed over a very pretty bouquet relating to the writer's stories in the Automobile Dealer and Repairer. Then he proceeded to get even by asking some of the toughest questions that could be thought out in a "week of Sundays."

In his letter, Mr. Schuman says the trouble he now has to contest with is in connection with a Cadillac, 1910, which he purchased new and has been driving ever since, doing his own repairs as required and overhauling the machine as necessary. But he is now having trouble from vibration of the motor. He has recently had the car down, the motor completely overhauled and replaced in an A-1 manner, but it still vibrates badly. He has also written to the factory and they tell him to "tighten the bearings," but that did no good. The factory also told him to put in lighter pistons and that would help. He has weighed the pistons now in use and finds them to weigh 5½ pounds, without connecting rod or wrist pin, and he asks if lighter pistons would do away with the vibration which troubles him and would he get more power with the lighter pistons.

He does not care to have aluminum alloy pistons but would rather have a set of light cast pistons and wishes to be advised if this would cure the vibration and also give more power from the motor. He also wishes advice concerning any other way out of the difficulty.

Motor Vibration.

This trouble is one which has been with the reciprocating engine ever since James Watt jumped the lid off the tea kettle and started into the engine business. With the slow moving old engines there was little vibration and what there was became absorbed in the heavy parts, but when we come to run engines from 500 to 2,500 revolutions per minute, there is bound to be more vibration, and we will never get fully rid of it until the rotary gas engine displaces the unmechanical reciprocating device which every engineer has trouble with. But while we cannot get rid altogether of vibratory engines, we can get rid of a good deal of the disagreeable vibration by adequate design and careful balancing of the reciprocating parts as fully as possible. As stated, this is one of the worst things to be handled in engine design and the vibration though it may be greatly reduced by proper counterbalancing, can never be eliminated entirely.

In locomotive engines they attempt to compensate for the vibration induced by the piston and crosshead mass moving at high speed by adding compensating weight to the crank. The counterweight is usually added to the wheels and is placed directly opposite the crank pin. There have been formulated rules for counterbalancing engines, also more rules, and then rules on top of rules, but these rules, one and all, fail to give perfect balance to the reciprocat-

Digitized by Google

ing parts. The vibration may be, and has been, greatly lessened, but it cannot be avoided or compensated altogether.

Rule for Counterbalancing.

The most generally accepted rule is to find the weight of the piston, cross-head (if any), cross-head pin and add to the weight thereof, one-half the weight of the connecting rod. Multiply this amount by the length of crank. If it is possible to affix a weight opposite to the crank, then determine the greatest convenient distance from center of shaft to the center of gravity of the proposed counterweight. Divide the result previously found by the radius of the counterweight, and the result will give the number of pounds weight which should be used as a counterweight. But in practice this weight is reduced according to the speed at which the engine runs, from three-fourths to two-thirds. Perhaps three-fourths is the most usually accepted figure.

But when the proper weight of a counterbalance is obtained, where are you going to attach it to an automobile engine? You can't attach weight to the crank discs, for there aren't any, or any room for

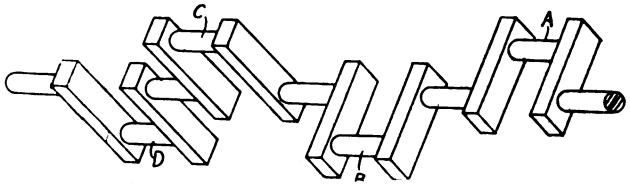

Fig. 1—Four Cylinders Opposed.

them. You can't attach the counterweight to the wheels as in a locomotive engine, because there is no direct connection between engine and wheel. In fact, there is no place in an automobile engine for balancing counterweights, therefore we can't well use them.

Light Reciprocating Parts Best.

But the above calculations do show us that the vibration of an engine depends principally upon the weight of the reciprocating parts. Therefore, it is evident that the lighter we make piston, rod and pins, their strength being adequate, the less will be the vibration of the engine. And furthermore, it will usually be found that the speed at which the engine is run has a good deal to do with the vibration of the engine, but it does not always hold that the faster the engine is run the greater the vibration, for there will usually be found some speed at which the engine will run more quietly than at any other speed. Sometimes there will be found two or more speeds, many revolutions per minute apart, at which the engine runs better and smoother than at any other speeds. This is true with other machines as well as with engines and it is due to the little known and less understood vibratory laws which govern and control many things of which the best of us at present know but little.

The calculations in the foregoing paragraph have one suggestive point, that the greater the weight of the reciprocating parts, the greater must be the mass of the counterweight which affixed opposite the crank, will make the engine run quietly, without vibration. This being true, it stands to reason that the lighter we can make the pistons and other reciprocating parts the less counterweight will be necessary and of course the less vibration without any counterweight. It is up to us to make and use as light a piston and connecting rod as possible. And aluminum pistons and rods, if we can make them stand up under the stress they will be subject to must materially reduce the vibration of the engine.

One point which was not stated in regard to this engine was whether or not the engine gave trouble by vibrating when first purchased in 1910. If the engine vibrated then as badly as now the cause of the excessive vibration must be looked for in the design of the engine. If, however, the vibrating developed later, particularly after being overhauled, wholly or in part, then the cause may be sought for in something which has been done—or undone—during overhauling.

It is quite possible that the excessive vibration—if it did not exist when the engine was new—may be caused, wholly or in part, by too great an advance in the spark. Explosion of compressed gas charges before the crank is fairly over or past the center surely puts nasty strains upon an engine.

In view of the many factors entering this question, I am not able to give as explicit an answer to the question of what causes the engine vibration as the gentleman asks for. The best I can do is, Yankee-like, to answer his question by asking those stated above. But one thing is certain: making the pistons and rods lighter will help matters a good deal.

There is another thing which affects the vibration of multi-cylinder engines, and that is, the manner in which their several cranks are arranged and the angle each crank makes with the other cranks. It is possible to construct an engine of the reciprocating type which will run practically without vibration. To do this, the cylinders must be double and opposed to each other in pairs if there be more than two cylinders. And the movement of the pistons must be such that in the opposed cylinders, both pistons are moving out, or in, at the same time. In the ordinary opposed engine one cylinder is moving in, the other out, at the same instant, thereby adding to instead of neutralizing the vibrations from each other.

Side by Side Balancing.

When two cylinders are placed side by side then the reciprocating parts in one cylinder almost perfectly balance those of the other cylinder, but the equalizing stress must all be transmitted from one cylinder to the other through the crankshaft. This being the case it may be possible to reduce the vibration of this particular engine by making a new crankshaft and rearranging the timing of the four cylinders. The four cranks should be arranged something as shown by Fig. 1, with each pair disposed at 180 degrees from each other as the reciprocating parts in cylinders A and B balance each other through the short length of shaft which connects them.

There is an opposite stress upon each crank which is exactly equalized through the short piece of shaft between A and B. In like manner, the cylinders C and D equalize each other's vibratory stress through the short length of shaft connecting cranks C and D.

In Fig. 2, which shows an arrangement of cranks frequently met with, the stress in cylinder A, due to its reciprocating parts, is equalized by similar opposing stresses in cylinder C. In this case the two stresses must be transmitted through two pieces of shaft, also through the crank, B. This gives a long route for the equalizing stress to follow and very much of the equalizing effect is evidently lost in

Digitized by Google

torsion along the shaft and crank, B, and absorbed by the several bearings which the shaft passes through.

The Non-Vibrating Engine.

An engine could be made almost absolutely non-vibrating by using two opposed cylinders, placed in line with each other and with cranks fitted in discs which should be formed into cut gears and meshed with each other. The cylinders should be so connected that they are carried by a rigid housing and when the cranks are assembled they should be exactly opposite each other so as to be both "in" or both "out" at the same instant.

This arrangement would give an engine about as free from vibration as it is possible in the reciprocating type, but this form would be of little use for automobile purposes. The arrangement shown by Fig. 1 seems worthy of consideration.

Selling Second-Hand Automobiles.

"What becomes of all the pins?" is a question which was old when the writer was a boy, and the answer is the same now as it was then, viz.: "I don't know!" The same question may well be asked regarding automobiles and the reply would be still more of a puzzle for autos don't slip out of sight quite as easily as pins.

There's another story about pins which might be well applied to automobiles. The boy who was required to write a composition on "Pins," started his effusion by the statements: "Pins are real life-savers. Many lives have been saved by pins by not swallowing them!" And accordingly, many lives must have been saved and accidents prevented by automobiles—"by not riding in them!"

But where do all the old autos go to? A census recently taken in Indiana shows that there is one automobile owned in the State by each thirty inhabitants, and they're "some smoke wagons" for the Hoosier State. According to calculations made by the assistant Secretary of State, 96,915 licenses have been issued, an increase of over 30,000 from 1914, and no one can even guess what number of cars will be owned in the State before 1916 is past.

This immense number of cars must mean the discarding of many thousand used cars for new and better machines and here the question as to what becomes of the old cars becomes very interesting indeed.

A great many used cars are altered into light delivery trucks and grocers, butchers, bakers and marketmen take to the converted vehicles like ducks to the water. Somebody has a chance to make good commissions in placing these used cars where they are wanted, and a chap in Cleveland, Ohio, seems to have the right idea regarding the sale and handling of used cars. Their method is certainly an innovation in the selling of second-hand cars and they say in their announcement—which may be of interest to some enterprising dealer—

> "We announce the opening of a new department to be devoted exclusively to the selling of second-hand automobiles strictly ON A COMMISSION BASIS. We believe that this is the only method which insures a fair deal to both parties concerned. We will have no personal interest in any car offered for sale other than a nominal commission to be paid to us ONLY in case of a sale. There will be no other charge. There are other advantages in doing business through us which will be made known by inquiry by letter, 'phone or by personal call."

Don't Do It This Way!

It may be regarded as pretty poor practice nowadays to make connection between any wire and binding screw by twisting the wire around the threaded stem and then screwing the head or nut down upon the wire. Get away from this very crude form of connection and let the screw clamp against a flat bit of metal which has been solidly attached to the wire.

But if you ever are forced to use the wire twisted-around method, then by all that is good, twist the wire around the screw in the direction that the watch hands move—never in the opposite direction. There's a reason for this, and a good one. When the wire is twisted around the screw "clock-wise" the nut, when it comes down upon the wire, will pull the wire tighter against the screw and make as good a connection as is possible in that manner. But when the wire is twisted around "contra-clockwise" the screwing down of nut or head forces the wire out and away, and it is almost impossible to make a good, tight and lasting connection with the wire twisted around "against the sun" or against the direction taken by the clock-hands.

Vibrator Springs Too Stiff.

I recently saw a man get "stuck" on the road from having too stiff a spring upon the spark coil vibrator. While the dry cells were fresh there was

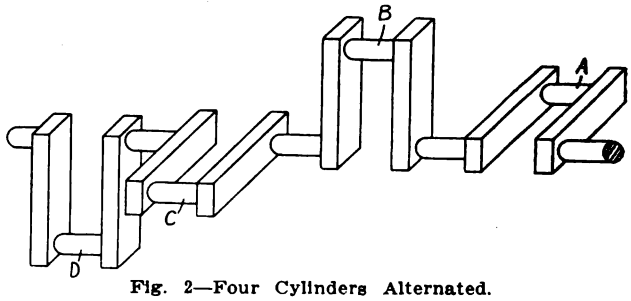

Fig. 2—Four Cylinders Alternated.

current to work the heavy vibrator spring in good shape but when the cells became weakened a bit from long use, there was not enough current to start the spring into making the first vibration, though once in motion it would work fairly well. The vibrator spring was weakened a bit by grinding it on an emery wheel (it could be done by filing and draw filing as well) and after the treatment the vibrator worked well on as weak a battery as would ignite the cylinder charges. You might look after this point with considerable advantage when there is trouble with the ignition missing at times, especially at starting.

Look Out for the Chamois Strainer.

It's a mighty good thing to strain the gasoline through a piece of chamois skin, but it's of little use to do so and throw the strainer down upon a dirty floor bench after using it. Then, next time you use the strainer there is a fine collection of dirt to be washed into the gasoline tank by the first liquid which passes through the strainer.

I saw another fool trick recently in connection with a chamois filter. It had been in use for some time and gasoline was very slow in passing through the chamois skin, so what did the user do but turn the chamois the other side up instead of cleansing it by washing with gasoline. But the gasoline went through all right, and that was what was wanted. But, oh, the dirt!

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

1760 His Brush Car.

From Herman H. Sunvald, Minnesota.—I have a Brush car that gives me some trouble in knocking and overheating. I have gone over the car but find everything O. K. The only thing I suspect is the carburetor, that is an old Kingston. Just as soon as I open the trottle the engine starts to pound, and I can turn off the switch and the engine will run along and pound (there is no short circuit), but as soon as I nearly close the throttle, the pounding stops. It does not matter how I keep the spark. This is when I run the car in high, it never pounds in low gear how fast the engine is running. It don't seem to pound or overheat so much when I have the gas tank full as when it is nearly empty. I have tried to adjust the carburetor in all manners but it don't help. I use high grade gas. Kindly let me know if you think a new carburetor would help matters. Would you prefer the air friction or Schebler's, and what model Schebler would be best suited for a Model E Brush car?

Reply.—Your motor is an old model with probably worn cylinders, pistons and rings. Undoubtedly your trouble results from carbon deposits in the cylinders, on the tops of the pistons, in the valve passageways and on the valve heads. Such being the case you could never prevent carbon deposits by changing carburetors. The carbon collects because with the throttle partly closed the partial vacuum within the cylinders draws the lubricating oil past the poorly fitting pistons and rings, and this oil does not entirely burn with the gasoline vapor and air, the unconsumed carbon remaining in the cylinders. Of course, if the gas itself is too rich it will aggravate the trouble. Both air friction and Schebler carburetors are recognized as good. The model Schebler carburetor recommended at the factory for Brush cars is either the D, 1 inch, or the H, 1 inch.

1761 A Bad Knock.

From W. J. Hemphill, Iowa.—I have a model 79 Overland car that has been run about 3,200 miles and seems to be in good condition at present with this exception: it has a very bad knock when it is forced to pull very hard. This knock seems to be caused by the carbon, in fact, I have had it cleaned about every 500 miles, and this relieves it very well but not altogether. I use Polarine altogether, but it does not call for much oil. The compression is O. K.. In fact, this is the only complaint I have to make at this time. Can you tell me why this should dirty up so quickly? And can you tell me how to fix it so that it will not? Can you tell me of any special rings that would help to overcome this trouble?

Reply.—Preignition as a result of carbon deposits is caused usually by too much oil in the cylinders. It is possible that your rings may not fit as they should; you may have run the engine some time without water in the radiator, or you may be using a light Polarine oil when a heavier grade would give you better results. To discover the exact cause it would be necessary to disassemble the motor and note the condition of the cylinders, pistons and rings. If the cylinders are scored there are no rings made that will remedy the trouble. There are several makes of piston rings advertised in every issue of this publication, but to equip your motor with new piston rings is an operation to be entrusted to some one who really knows how they should be fitted, not to an amateur. Before prescribing a cure in your case we would have to know for sure just what causes the excess carbon deposit. See our reply to Hermen E. Lunvelt, Minnesota, in the next issue.

1762 Chipped Differential Cogs.

From O. F. Berg, Minneapolis.—I have a Buick, model 29, which has run about eight thousand miles. Why does it chip the outside corners of the cogs in the differential ring gear from ¼ to ½ inch in length? I have heard of several others with the same model complain of the same. Now the gear is not worn that one can see, nor is the pinion. These pieces get in between the cogs and make a pounding noise.

Reply.—Chipping of the outer ends of the teeth of the driven differential gear can only result from one or two primary causes—either imperfect gear teeth or faulty alignment. These gears are hardened and may lose their perfect shape during this operation, but the most probable theory is that the bushing or bearing directly ahead of the bevel driving pinion is somewhat worn, throwing the axis of this shaft slightly out of line with the differential shafts. The bearings of the differential shafts must be looked to as well as the other above referred to, although their normal wear is not so great.

1763 Intermittent Missing.

From James Thomas, Oregon.—On my Buick 1913, model 40, I have a Stromburg carburetor, and I find that in climbing a hill it will give an intermittent missing. But if I adjust it down and give it more air through the carburetor, it will stop missing, but this seems to make it difficult to crank. Then I have to set it back about 8 notches and give it less air and then it will crank much easier, but as soon as I get it started I will have to give it more air through the carburetor. Please tell me how to prevent this inconvenience.

Reply.—Your trouble is by no means an unusual one. Its cause is too poor a mixture at low speed and too rich at high. You can probably remedy this by using new inlet valve stem bushings which fit the inlet valve stems more closely, preventing air leaks to impoverish the mixture. You should be able to remedy the trouble in a measure by increasing the gasoline supply and slightly reducing the tension of the automatic air valve spring.

1764 Clutch Trouble.

From E. W. Kruse, Missouri.—We have an Overland car, model 25, 1910, touring car. This car has given good service. Lately, in running along even on a good road, when a wheel strikes an obstruction, a clod or stone, the clutch, which is a multiple disc, slips and the engine races, and when the clutch pedal is jerked up by putting the foot under it, the clutch will catch again and run until the next small bump it strikes. We have strengthened the clutch spring on the outside, and this makes it strong enough to hold the clutch in place. May it not be possible that the rings, or clutch collar, or both, are worn so that they need repairing, and can this be done without getting new parts, which are rather expensive for this car? The car has made approximately 10,000 miles. We are certain of having made 7,800 miles. All valves have been reground once. Otherwise the car is in good shape.

Reply.—The symptoms described point out the fact that new friction plates are needed. Just why they are worn out may be as a result of normal wear or may be due to imperfect alignment of the crank shaft with the transmission shaft, imperfect adjustment, or some defect. For a car now in its seventh year a total mileage of but 10,000 is unusual, even if somewhat improbable. Automobile engineers have for many years been aiming to cheapen the first cost, as well as the upkeep, of multiple disc clutches.

1765 Long and Short Stroke.

From J. E. Scott, Indiana.—Which is the more powerful style of motor, that which is termed the long stroke motor or the one with the shorter stroke? If, in your judgment there is any difference, what is the difference and what advantage has one over the other?

Reply.—The power of a motor is governed by the area of a piston, the length of stroke and the number of impulses per minute, taken in connection with the mean effective pressure within the cylinder. The M. E. P., as it is usually called, is the average pressure, expressed in pounds per square inch, exerted against the piston during the power stroke. A motor of 6-in. stroke should be 50 per cent. more powerful than another of the same bore and stroke at the same number of revolutions per minute. the number of cylinders in both cases being the same. Experiments made by engineers indicate that long stroke motors are more economical than short stroke, the theory being that a greater expansion of the gases is possible and the exhaust can be opened when the pressure in the cylinder is materially lower than is possible in a short stroke, higher speed motor. Long stroke motors are very popular with automobile engine designers, manufacturers, owners and operators. Early stationary gas engine manufacturers years ago discovered that a stroke approximately 50 per cent. greater than the bore gave highest efficiency. Carburetion is much more easy in long than in short stroke motors.

1766 Battery Information.

From Fred Mank, Pennsylvania.—I am anxious to have a few questions explained. We have a small motor which requires two and three dry cells of 75 to 25 amperes connected in series to run for a boy's "Meccano" outfit. Now I would like to make them a wet battery, which I suppose is longer lived and cheaper. How many ½ or 1-gallon jars must be connected in series, or how, to obtain from 2 to 4 volts, or, in short, the necessary power.

Reply.—Sal ammoniac wet cells have to use carbon and zinc elements, the carbon element containing black oxide of manganese as a depolarizer. If you are to use copper and zinc elements the electrolyte must be sulphate of copper or blue vitriol, dissolved in water, the copper being at the bottom of the jar and the zinc at the top. This type of battery was and still is used largely for closed circuit work, such as for telegraphy, and is usually known as "crow foot," from the shape of the zinc element. It is in reality the gravity type. You can buy these cells much more cheaply than you can manufacture them. They must remain quiescent, not moved about, for if the electrolyte becomes at all disturbed, the entire battery solution soon becomes ruined. Each cell will give you something less than one volt. You will find that dry cells in the end are more economical than wet sal ammoniac, a dry or wet cell giving the same voltage, no matter what its size. The only object of using large cells is longer life. Just what a "boy's meccano outfit" is we do not know.

1767 A 1909 Cadillac.

From H. L. Dessar, New York.—I am overhauling my Cadillac, 1909 car, and would appreciate your opinion as to the utility of several contemplated changes. Since the cold weather set in the car has not run satisfactorily as the motor missed badly when idling or running on a level road, but would fire regularly when pulling on a grade. The car is equipped with a Stromberg carburetor, type 4B, bought new about a year ago, with a hot air attachment from the exhaust manifold. The ignition is from two independent systems, there being two spark plugs in each cylinder. A battery with a four-unit coil supplies the starting spark and a Bosch high tension magneto, type DU4, gives the current for running. On inspection, after the motor was down, all parts looked good, bearings tight and piston rings all bright, but in the third cylinder the opening of the three rings were in a straight vertical line. There was also considerable soft carbon in the combustion chambers and on the piston heads.

1.—Do you think that this condition would account for the misfiring? 2.—If the pistons were fitted with some type of non-leaking rings would the motor be more efficient? 3.—Would one non-leaking ring per piston be enough? 4.—Would coiling a piece of ⅜" O. D. copper pipe around the vertical part of the intake manifold, for about six inches, and connecting same with the water circulation, give sufficient heat to avoid condensation of the gasoline as supplied to-day? 5.—In your opinion would the benefits derived warrant the expense?

Reply—1.—If by "condition" you refer to the piston ring partings being in line vertically, probably not. More likely the rings are so badly worn that the piston ring partings are too wide. The piston and cylinders probably are also worn and are possibly scored. If you will examine your inlet valve stems and bushings you quite likely will find either one or both badly worn, an additional possible and probable cause of missed explosions. 2.—They probably would if properly fitted, but such rings could not be expected to remedy trouble caused by

Digitized by Google

worn or scored cylinders or pistons fitting too loosely. 3.—One is better than none, two to a piston better than one and in many cases three to a piston have proven better but then not entirely satisfactory. The better the cylinder surface is the less work there is for the rings to perform. 4.—It should not do any harm. If a 6-in. coil of ⅜" O. D. tubing helps, the longer it is the better the results, provided of course you can get a circulation of hot water through it. We have no means of knowing whether the short or long coil would do the trick. 5.—If the work were properly done it might. It would be an experiment, however, and experience such as you desire is rather high priced as a rule.

1768 **Temper Drawing.**

From Walter L. Miller, New Mexico.—Through your Trouble Department I would like to find out how I could draw the temper on the Armstrong Self Hardening Steel, that is used for lathe tools.

Reply.—Self hardening steel can be forged and ground, but cannot be filed or machined. High speed steel can be annealed by burying in lime while very hot, but after such annealing, a property not possessed by the former, it has to be re-tempered.

1769 **Undue Gasoline Consumption.**

From Henry Ryg, Frost, Minnesota.—1—We own a Maxwell, 1915, 5 passenger car. Bought it last May. We have been bothered with gasoline consumption, as it uses as much as one gallon of gasoline to every 10 miles. We have had it repaired at two different garages several times, but without receiving any help. They have looked over the carburetor and said that it needed cleaning and they cleaned it but it did not help any. The carburetor is a K.D. They have closed the needle valve as much as it is possible to do. If they should close it more it wouldn't run. It leaked before but I have not discovered any leaking now. I shut the gasoline off when I stop the motor. If you know anything that would help so that it would not burn so much, please let me know. 2—Will a Maxwell car run as many miles on low gravity gasoline to the gallon, as on higher gravity gasoline? 3—Will the storage batteries freeze if allowed to stand in the car in an unheated house in winter, if the motor is started once a week? 4—Do you believe it hurts the storage batteries to take them out and let them stand in a hot house over winter, without any care?

Reply—1—If impossible to decrease your consumption of gasoline by adjusting the carburetor it indicates that the carburetor itself is at fault or that the trouble is somewhere else. This you should be able to determine by temporarily connecting some other make of carburetor, for instance one which was sent out with the car when new. Almost anyone selling carburetors would be glad of an opportunity to change carburetors on trial. 2—This depends entirely upon the condition of the motor, the type, make and size of the carburetor and its adjustment. A gallon of heavy gasoline contains more heat units than does a gallon of lighter and more easily vaporized fuel. 3—Yes, if the weather is cold enough and the battery is nearly exhausted. They should be kept fully charged and put under charge every week or two. 4—We not only believe but we know it will seriously injure them.

1770 **Lighting and Starting Trouble.**

From O. W. Martenoon, Colorado.—I have an Overland car, Model 81. I am having considerable trouble with the starter and lighting system. The storage battery seemed to leak a little about a month ago so I took it to what was supposed to be a battery expert, and about three weeks after I went out one morning to start the engine and the battery seemed to be dead. I started it with the crank and run it to town about twelve miles. The lights have worked ever since, except when I try to use the starter. The instant the starter is engaged the lights will go out, but the starter will not turn the motor. The lights will not burn again until about two or three minutes after the starting pedal has been released and the motor not running. Then they will burn as bright as ever, but the minute the starter is engaged the lights go out. It is a 6V. U.S.L. battery. If the motor is run above twenty miles an hour when the lights are turned on it will burn the bulbs out.

Reply.—The combined starting and lighting system used with this car utilizes a direct current generator with a governor to prevent the voltage from reaching such a point that the lamps burn out. Your governor therefore, does not release as it should, hence the burned out bulbs. Your battery is probably pretty well discharged, is possibly sulphated, and suffers like lots of others from unintentional abuse. You should write to the manufacturers of your storage battery, or for that matter of any make of storage battery, for their explicit directions for the care of batteries, and you should carefully follow the instructions so plainly given in the instruction book sent out by the Willys-Overland Co., with every car. Your battery is probably practically ruined, and it may cost a considerable amount for repair and renewals of plates, etc. If you send it to the manufacturer you should empty out and thoroughly wash out the electrolyte before shipping. The U.S.L. battery is made by the U. S. Heating and Lighting Co., Niagara Falls, N. Y. The nearest agency of the Willys-Overland Co., should be able to give you some assistance.

1771 **Misfires, Pops and Jerks.**

From S. R. Fulcher, North Carolina.—I have a 1913 Ford car that has not been run over 10,000 miles. Will you explain to me through the Automobile Dealer and Repairer why it misfires and pops and jerks running around on the streets, but when taken out in the country where the roads are soft and it takes more gas, it pulls as good as when new.

Reply—It probably needs the attention of some good repairman to locate the trouble, which may be in the ignition, carburetion, or physical condition of the engine's cylinders, valves, pistons, rings, or valve springs. Your query is so indefinite that to answer it any ways clearly would necessitate at least a score or two of Yankee guesses. Probably proper carburetor adjustment, or a later model should help.

1772 **Ford Magneto Trouble.**

From Oscar O. Romundstad, Wisconsin.—Please tell me in your next issue what could possibly have been wrong with a model 1916 Ford, which has only been used a little. The lights became very feeble and glowed very little. The bulbs, wires and switches were all changed all to no purpose, evidently, as

Digitized by Google

there was no improvement. They say there was a good ground connection and the motor runs good, and ignition is perfect. Neither high nor low speed would improve the lights.

Reply—If you will remove the small brush attached to the terminal at the top of the flywheel megneto housing, you will probably find some carbonized fibre hair like particles attached to it which should be removed carefully. You may have an imperfectly grounded connection in your lamp circuit, even if you are told that it is perfectly grounded.

1773 **Fuel Qualities.**

From R. Blondel, Massachusetts.—Will you kindly tell me which is the best explosive mixture, dry hot air with gasoline, or hot damp air and gasoline, or a little hot steam added to the air and gasoline vapor?

Reply.—We are going to let you decide this query after telling you something of the physical characteristics of the three mixtures mentioned, presupposing that each one has the perfect proportion of air to gasoline vapor. It is a law of physics that nearly all metals and practically all gases and fluids expand with the application of heat. Air also expands under heat hence a cubic foot of air at atmospheric pressure would contain more oxygen at 60 degrees Fahrenheit than would a similar cubic foot of air at atmospheric pressure if heated to 90 degrees. This is equally true of the vapor of naphtha. If the charge of air and gasoline or naphtha vapor is hot it will contain less heat and power than if cool—but it must be hot enough to thoroughly vaporize and hold the gasoline vapor in suspension, unless the gasoline has been thoroughly pulverized by the air passing the vaporizing nozzle at high velocity. If the air is saturated with moisture, as on a damp day, unless it is preheated this moisture will collect in the throttle structure and inlet manifold in the form of small particles of ice, but if heated sufficiently to prevent such a deposit, at certain motor speeds there is an appreciable increase of power noted. In some types of stationary internal combustion engines operating at low piston speed, water is taken into the combustion chamber, as well as gasoline vapor and air, for a two-fold object—primarily to lengthen the actual time of combustion, and thus increase the power, and secondarily to prevent carbon deposit. On a heavy atmosphere most motorcar motors "pick up" much better than when the atmosphere is dry and light, but as the engine speed is raised, increase of power becomes less and less noticeable until at high speed there seems to be little if any difference. If superheated steam were introduced to a very cold mixture, or saturated steam were introduced to a warmer mixture of air and gasoline vapor, it might increase the power, if under automatic control, at no time being in excess of the proper amount, at low engine speed, but it is extremely doubtful if any improvement would be noted at the high engine speed at which most automobile engines are to-day operated.

1774 **Two-Cycle Automobile Engines.**

From Fred E. Snyder, Illinois.—A friend and myself have been having quite an argument as to the number of cycles an ordinary automobile engine is supposed to have. I am positive that a very large majority of the automobile engines of today are four-cycle engines. Am I right? What is the meaning of cycle in relation to a gasoline engine? What are the names of some of the two-cycle automobiles sold to-day, if any?

Reply—An automobile gasoline engine has one and only one cycle. If this cycle or completion of operation is completed in four separate strokes of the piston in any one cylinder, it becomes a four-stroke-cycle, usually and improperly called a four-cycle engine. Practically all motorcar engines are today, even in spite of our worthy disciple and expounder of two-stroke-cycle possibilities, Mr. Charles E. Duryea, of the four-stroke-cycle type, and we confidently believe they will continue to be of this construction for many decades. We do not know of a single two-stroke-cycle automobile on the market, with the possible exception of the Chase, manufactured in Syracuse, N. Y. This is a commercial car.

1775 **Trouble With the Starter.**

From P. Presson, Minnesota.—1—I have an Overland model 79, 1914, car, with Gray & Davis starter and generator. Would it hurt the generator to run the machine with storage battery off, or have all generators safety devices for such occasions? 2—With battery removed could I change the wiring so as to get current for the lights direct from the generator? If so, how? Or, would I thereby burn out the bulbs? 3—On the 1915 Studebaker the storage furnishes current for ignition. Now, could you give me a diagram for changing the wires so as to get ignition direct from the generator, in case you must remove your battery. I know it has been done, but have forgotten how.

Reply—1—Motor car manufacturers warn owners against running the car with the battery removed. We understand that Gray & Davis and similar direct current systems do not have such safety devices. 2—No. You would burn out both bulbs and generator. 3—The 1915 Studebaker system is an improvement over that used on the 1914 Overland. We advise you to write to the Gray & Davis Co., Boston, Mass., who will advise you just what additional equipment is necessary, also of the wiring, in case you desire to combine ignition with starting and lighting. If you must remove your battery you must also remove the magneto, or at least the magneto brushes, if you run the car.

1776 **Lubricant Qualities.**

From William H. Corbett, New York.—1—Will you kindly tell me whether there is a benefit in using castor oil as a lubricant in an engine, in preference to other oils? 2—Why do racing cars use it? 3—Does it carbonize as much as other oils? 4—What benefits, if any, has is over other oils? 5—Has it any harmful effects?

Reply—1—In certain cases—yes. Revolving cylinder aeronautical engines have to use castor oil, no other kind answering the purpose. It is never used alone in any other types of internal combustion engines. 2—Racing motor drivers use it with their usual mineral oil lubricant on account of its high viscosity and the fearfully hot cylinders of their motors, and although its use causes heavy carbon deposits they do not need to run their engines slowly enough to be troubled from preignition. 3—Much more so. 4—Answered in reply to query No. 2. 5—No.

Digitized by Google

1777 **Gasoline Efficiency.**

From Guy G. Ebert, Pennsylvania.—1—Gasoline generally used runs from 60 to 62 degrees. Would a gasoline 72 to 76 degrees be less liable to carbonize? 2—Would a gallon of 60 to 62 degree gasoline run as many miles (all other conditions being equal) as a gallon of 72 to 76 degrees, or wouldn't you deem it advisable to use such a high grade of gasoline.

Reply—1—Possibly. 2—To use the heavier gasoline efficiently would necessitate having a more modern carburetor than if using the much more volatile 74 degree product. It will cost considerably more per mile to use 74 degree than the usual motor gasoline procurable, and be much harder to procure.

1778 **Size of Tires.**

From X. Y. Z., Ohio.—1—Please answer in your next issue whether you consider a 3½ inch tire sufficient to carry a car weighing 2200 lbs., without passengers. 2—Can I use a 4 inch tire on the same rims as the 3½ inch tire?

Reply.—1—A 2,200 pound car, unless you are to pile in six or eight heavy people, should run satisfactorily on 3½" tires. If you will write to the manufacturer of the tires you are using or contemplate using, he will gladly furnish you some valuable tire information gratis, sizes for various weights, inflation pressures, care, etc. 2—Yes.

1779 **Valve Reseating.**

From Otlus Wheat, Texas.—Kindly answer through your columns if the valves of a model T Ford engine could be replaced with larger ones. What I wish to do is to make the valve opening larger, and drill out the valve guide. Through some careless workman the valves have been reseated so that the head of the valve when seated is down in a recess of about 1/16 of an inch. In your opinion, if this is possible, which I am sure it is, what size valve could I use? Also where could I get a reseating tool for the valve?

Reply—Yes, you can do what you suggest. Use an adjustable valve reseater. You can purchase this tool by addressing Suite 701, 30 North Michigan Avenue, Chicago, Ill. Care should be taken not to cut away too much material. You will need valves with larger heads, the size to be determined by the seat cut in the cylinder.

1780 **Fuel System Trouble.**

From John E. Wood, New York.—Will you kindly diagnose the trouble with my fuel system? On my Pullman, 4-cylinder car, I am using an old type of Stromberg carburetor, without a hot-air intake. Every time I stop my engine about a quarter of a pint of galosine drips from the air intake at the bottom of the carburetor. There is no leak of gasoline at any other time, and this trouble is not manifest when the engine is very hot.

Reply.—There are two mediums utilized in the vaporization of gasoline in an internal combustion motor, air velocity pulverizing it and heat to not only vaporize, but to keep the pulverized and vaporized gasoline from condensing back to liquid form after it leaves the mixing chamber. Gasoline today is much heavier and less volatile than when your motor was new. Later and more modern carburetors are designed with smaller fixed air openings to give the air higher velocity and in addition to hot water jacketing the throttle valve structure, provision is made to use heated air. In your case the gasoline is not properly pulverized and vaporized, a quantity remaining in the inlet manifold at all times in liquid state while the engine is running, the partial vacuum in the cylinders drawing air and gasoline vapor past it, preventing it from running back through the carburetor until the engine is stopped. Your only remedy is a carburetor of later model designed and constructed to prevent "loading up" of the inlet manifold with condensed and improperly vaporized gasoline. Although you do not so state, there is probably an extraordinary waste of fuel.

1781 **Magneto Trouble.**

From Harry H. Shawl, Kansas.—Could a low tension Remy magneto be fixed so it would not absorb the strength of dry cell batteries, in running the current through it to run the motor? We have a Buick car with plain coil and the magneto is not working satisfactorily. It probably should be sent to the works for repairs. I have heard that batteries are used up six times faster through the magneto than where not used through one. The magneto has the breaker box and distributor on it, which, of course, has to be used for proper ignition.

Reply.—The low tension Remy magneto has a long contact at the circuit breaker in the breaker box and uses up battery rapidly as a result. Your only remedy is to get the magneto repaired or equip the motor with a single-spark battery ignition system, one that uses battery current economically.

1782 **A Lubrication Inquiry.**

From W. J. Hill, New York.—What would be the advantage of using the same oil in a Ford car that is used in the Franklin? And what are the objections, if any?

Reply.—The Franklin is an air-cooled motor and the cylinders get very much hotter than do those of a water-cooled engine. Again the cylinders of a Ford, cooled by thermo syphon rather than by a mechanically circulated system, get nearly as hot as in a Franklin. As a result cylinder oil adapted for use in a Franklin would be better suited for a Ford than some other makes. About the only objection we could raise would be that it might have a slightly higher fire test than would give best results and cause excessive carbon deposits. The manufacturers of a motor car should be best able to judge of the oil best adapted for use with their individual product, although some manufacturers of motor oils have expended large sums of money in making tests of all the principal makes, models and types, while unfortunately for some car owners there are oil dealers who advise brands manifestly unsuited for use in certain makes and types of cars.

1783 **Removing Battery Connections.**

From W. H. D., New York.—Kindly tell me how to remove the heavy load connections which join my storage battery plates. The battery is a "Pumpelly" 1915. Connections are seemingly driven on. I need to replace one cell, which is leaking.

Reply.—These connections are probably "burned" on by the process known as "lead burning," a hydro-

Digitized by Google

gen flame melting and fusing the connector to the plates. You will probably have to take the battery to some one who is equipped to do lead burning in order to replace the defective cell. A year or so ago the Pumpelly storage battery was manufactured by the Pumpelly Battery Co., Indianapolis, Ind.

1784 **Ignition Inquiries.**

From J. E. Hess, Massachusetts.—Since its infancy I have been a subscriber and reader of the Automobile Dealer and Repairer with much interest, as well as instruction, and now for the first time may I ask you two or three questions in relation to the model 79 Overland, 1914, car, equipped with Splitdorf low-tension magneto and coil for ignition? 1—Is it practical to use two ordinary spark plugs in each cylinder for ignition, one in place of the priming cup in addition to the regular plug? 2—Do you personally know whether the results obtained by installation of the Su-Dig series plug would warrant my installing same in my car? This plug is advertised in your publication. Any information would be thankfully received.

Reply.—1—Not unless you have two separate ignition systems or a two-spark independent type of magneto. 2—The Su-Dig plugs are highly recommended, and quite likely the manufacturers would be willing to send you a set on trial to be retained only if they give the results claimed for them.

1785 **Platinum Points Ruined.**

From N. Scholl, New Jersey.—As I am experiencing some difficulty with my car, I herewith take advantage of your offer to furnish information concerning car troubles. My car is a 1914 Ford, equipped with master vibrator, Briggs & Stratton make. The platinum points on the vibrator springs wear very rapidly, lasting only about 300 miles. I have tried all manner of adjustments, but to no avail. While the motor is running there is a continuous flame at the platinums, which of course causes this rapid deterioration. My car gets its light, as is the usual way, from the magneto, and I find that when the lights are switched on this flame at the platinums immediately disappears.

Reply.—There is little doubt that the condenser of the master vibrator has broken down, as one mission of the condenser is to prevent arcing at the contact points. With the lights switched on, the amperage of the current used for ignition is very much reduced, correspondingly lessening the arcing at the contact points.

1786 **Sparks, Coils and Wheels.**

From Wm. J. Temple, Nebraska.—1—Could 110 volt A. C. be used to spark a stationary engine by means of one of these commercial bell-ringing transformers? The engine is equipped with a jump spark coil, which is operated by four batteries at present. 2—Would there be any danger of injuring the coil if operated in this manner? 3—About how much current would be used from the 110 volt line? 4—Is it detrimental to the car in any way to run one plain tread and one non-skid on the rear wheels at the same time?

Reply.—1—It possibly could be done. 2—If your coil is designed to operate on but four dry cells—yes. 3—Four dry cells give approximately 6 volts. You would have to use some sort of a transformer, or a bank of. say, 17 or 18 6-volt lamps in series with the coil. It would take a considerable current and would be more expensive than dry cells. A small belt-driven magneto would be much simpler and more economical. It should not cost more than $10 to $15. 4—It might cause extra work for the differential, one wheel slipping and the other doing most of the work.

1787 **Battery Information.**

From W. W. Mowland, Maine.—1—I would like to know how to disconnect the storage battery of a 1915 model 80-T Overland car. 2—I should also be pleased to have you advise me as to what is the best and strongest storage battery. The present one is a U. S. L. battery and will not start a car in cold weather. 3—I should also like to know the name of the storage battery used on new 1915 4-cylinder Buick cars.

Reply.—1—Disconnect the wires from the battery. Do not attempt to run the engine with the battery removed unless you also remove the generator, or at least the generator commutator brushes, for it means that, unless you do, you will utterly ruin it. 2—The U. S. L. is a good battery, but will not stand abuse, nor for that matter will any other make. If you do not keep it properly charged, replace the water which is decomposed, and charge it every week or two by running the motor and noting that the generator is generating electricity as it should, you will always encounter trouble. 3—The 4-cylinder 1915 Buick uses the Exide, manufactured by the Electric Storage Battery Co., Philadelphia, Pa.

1788 **Removal of Pins.**

From E. P., Iowa.—Will you please answer the following question through your Trouble Department, as I read the same with interest? It will be noted that there are different thrust plates on each side of the differential gears. It sometimes happens that these plates wear considerably, and this also wears the two pins that hold these plates up, so that the plates drop down on the axle shaft roller bearing. Will you tell me how these pins are removed and new ones put in?

Reply.—Owing to the fact that you omitted the very necessary information—the make of your car or of the rear axle and differential, we fear that our reply will be rather unsatisfactory, as it will have to be in general rather than specific. If, as we understand it, the pins are used to prevent the thrust plates from rotating, they may be driven in or screwed into place. If the former, it probably will be necessary to drill them out, using a drill of slightly less diameter than the pins. If taper pins are used they may be upset or riveted over at the small end, in which case it usually is necessary to drill a little distance into the small end before they can be "backed" or driven out.

1789 **Wiring for Lighting and Ignition.**

From Louis L. Hills, Maine.—1—Kindly inform me how to connect a tail light and dome light to a 1915 Ford magneto? 2—Also how to connect dry batteries for ignition. I spent some time and much energy trying to remove the glass from the Ford headlight. I found it very simple by placing a flat file against the rivet beneath the rim and striking

Digitized by Google

the file with a hammer, making the rim turn to the left or counter-clock-wise.

Reply.—1—Use two 6-volt lamps in series, one lamp grounded to the chassis frame, a wire connecting the other lamp terminal of the grounded lamp with the second lamp, and with the remaining terminal connected to one pole of a single throw lighting switch, connect the other pole of the switch with the wire which leads from the brush contact terminal on top the magneto or flywheel housing. 2—Connect one pole of a battery of four dry cells, wired in series, with the metal chassis frame, and the other with the battery connecting pole of the ignition switch.

1790 **Lighting from the Magneto.**

From Dr. R. B. Scofield, New York.—I have a Ford, model T, car with the new type magneto. I would like to have four electric lights run from this magneto, two for side lights, one for tail light and one for a dash light. Can I run these all in one circuit, and if so what lamp—that is, what bulb should I use? Is there a more satisfactory way of wiring? Of course I do not want to injure my magneto. Thank you for the information.

Reply.—You can use four 3-4-volt lamps in a single circuit or you can use two 6-8-volt lamps in each of two circuits. The side lamps could be any candlepower desired, but higher of course than the rear and dash lights. If the lights interfere with ignition you could use lower candlepower bulbs, but you should not reduce their voltage, else you will burn them out. Remember, if two are wired in series the voltage should be 6-8, and if four in series, 3-4.

1791 **A Transmission Click.**

From A. E. Brown, Massachusetts.—I have a 16-20 horsepower Hupmobile runabout. All at once I noticed a click in what seemed to be the transmission, and it was only noticeable in the reverse gear. I have drawn out all of the oil and examined the gears and every tooth is all right. The click comes at every revolution of either the drive shaft or one of the gears. When I take off the cover of the transmission it sounds so plain that it seems as though I could see where it is, yet I can discover nothing, as every gear is perfect. The more power I use in reversing the louder it sounds. It sounds like a set screw dragging, as near as I can describe it.

Reply.—It will be necessary to remove the reverse gear and reverse gear shaft, in all probability, in order to discover where and what the trouble is. We regret that we are unable to advise you any more definitely but we can gather but little information from your inquiry from which to formulate a diagnosis of the probable trouble.

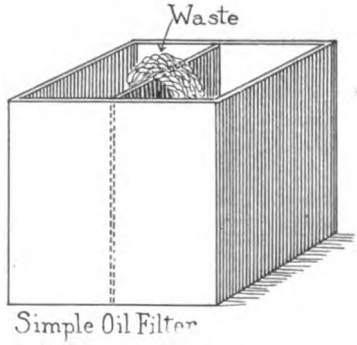
1792 **Kerosene and Gasoline.**

From Ralph A. Guth, Pennsylvania.—Is it possible to use, with satisfactory results, a kerosene-gasoline mixture in a model 83 Overland car? If not, why not? I am using a mixture of one part kerosene to four parts gasoline in a stationary 1¾ horsepower gasoline engine, make-and-break jump spark ignition. It runs just as well as with a pure gasoline; no trouble to start on mixture.

Reply.—The mixing of kerosene and gasoline in a variable speed engine is not desirable, though it is true that some engines can be run on such a mixture, with possibly a slight gain in fuel economy. Kerosene is much harder to vaporize than gasoline and the two fuels do not mix readily. The consequence is that there is always a strong tendency for free kerosene to enter the cylinder and cause corbonization and overheating. Moreover, such a mixture is not easy to start on and cannot be satisfactory for winter work.

1793 **A Persistent Knock.**

From C. W. N., New York.—I have a car, in use four years, which troubles with a knock in the engine. I took it to a repair man and was informed that the connecting-rod ends required adjustment. This was done, but since trying the car the knock is still in evidence; if anything, it is worse than before. It is most noticeable when the ignition is advanced, and on a hill I have to retard the spark as much as possible to prevent excessive knock; in any case I cannot stop it entirely. Can you offer any suggestions?



Reply.—It may be due to faulty timing of the spark. It was probably set correctly originally, but the magneto drive may have slipped a little and it requires resetting. Of course, if the cylinders have not been cleaned free from all carbon a knock may occur with correct timing. The cylinders should have been decarbonized when the engine was taken down, otherwise it will be impossible to drive without the knock occurring except possibly by retarding the spark to such a degree that a great loss of efficiency is caused.

A Simple Dimming Device.

From W. H. Hooner, New York.—For anti-glare for my car lamps I had our glazer cut two pieces of Florentine glass for me, and I put one piece in the door of my Presto headlights in place of the clear glass, smooth side out, making it easier to wash off the street mud. The headlights are all any one needs for night driving and there is absolutely no glare, just a strong white light. I hope this will help plenty of others as it has me. It surely will cover the law and still give plenty of light. I firmly believe the glaring headlight is the most dangerous thing on any road (to the other fellow) that there is, outside of ice. Any glazer should cut 2 pieces of Florentine glass, 8 or 9 inches in diameter, for not more than 25 cents for the two pieces.

A Simple Oil Filter.

From F. E. Poister, Kansas.—Take an old five-gallon oil can, solder a partition in the center, making it oil tight. Pour your dirty oil in one side and

Simple Oil Filter

saturate a piece of waste with oil and hang it over the partition so one end is immersed in the dirty oil. By the action of capillarity the oil will flow from one side to the other, leaving the dirt behind.

Digitized by Google

Setting Automobile Wheels.

From Massa & Boggs, California.—We note the article by Mr. Blue in your December issue, regarding setting of automobile wheels, and while he has the right idea, we must say we would consider the method of wrapping narrow strips of iron around the felloe very crude. We set numerous automobile wheels in this locality, and our method is as follows: Remove the channel, either by heating slightly, or if loose enough drive off. If the spokes are loose, remove the hub and wedge the spokes at the hub with thin pieces of band steel. Take the measure of the felloe and channel the same as you would a wagon tire and then build up to size with the proper thickness of band iron, put around the face of the felloe in half sections, and secured with a small nail countersunk at each spoke. When the tire or channel is heated and put on over this, it makes a perfect job and the band iron does not show, as Mr. Blue's does, thus making also a very neat job. The stem hole and bolt holes are drilled through the band iron after the channel is on.

We have set as many as twenty wheels in one day without a come back on account of getting loose.

Driving Wheels Pull Best.

From N. G. Near, New York.—I have been asked: "Why can an automobile often back out of mud holes, where it can't get out frontwards?" My explanation is this: For the same reason that a man can pull a greater load on a wheelbarrow than he can push. Where the power pulls, as where a horse is hitched to an automobile that is "stuck," the advantage is greater than where the power acts as a push, as in the automobile going frontwards. In some cases truck builders are now building trucks with the power driving the front wheels instead of the hind wheels. Greater loads can thus be pulled. Rubber tires are used on the front wheels, whereas steel is used on the hind wheels. Since most of the load rests on the hind wheels, it is evident that there will be a good year-in-year-out saving in rubber bills, with the engine resting on the soft front rubber tires; it is protected against severe jarring. The front wheels also do the steering, which they can best do, of course; and the front wheels can pull more than the rear wheels could push. We, therefore, have an ideal combination in such an arrangement.

Next time you are stuck, then, it will be well to remember the above. Make the driving wheels pull.

Electric Lighting.

Owners of cars lighting by acetylene gas or oil can equip their machines with the straight battery system of electric lighting at a moderate cost. Such a system will prove decidedly convenient for it eliminates the trouble of lighting lamps and smoking. One does not require a technical knowledge of electricity to instal such a system, and the wiring is simple as indicated by the drawing. The plan is adaptable for the side and tail lights, or tail and headlights if preferred. Generally the former is employed as the use of bulbs obtaining efficient lighting in the headlights consumes considerable current.

The changing over of the oil lamps into electrical units is a simple matter as there is a large variety of converters and adapters marketed. These units can be clamped over the oil burner or inserted in the side of the lamp, an installation permitting of the use of the oil members when desired. Three converters will be required, two for the side lamps and one for the tail light. Double connectors permitting of breaking the circuit as when displacing the lamp is displaced for cleaning, etc., are preferred, but they can be dispensed with. A switch, preferably of the push and pull type, although an ordinary member will do, some No. 14 or 12 B. & S. gauge insulated wire, cleats and tape completes the equipment aside from the battery. While dry cells wired in series or series multiple may be used, owing to their high price it is cheaper to utilize a storage battery as the latter can be recharged at a slight cost, and if properly cared for will last a long time. In the wiring plan shown there will have to be made three splices which are made by stripping the insulation and binding and soldering the bare wires at the points marked splices in the sketch.

If a six volt battery be employed, six volt lamps will be required, and by using two candlepower tungsten bulbs, economy of current will be effected. The amount of lighting or service from the battery will depend upon its capacity. It is easily figured. Three

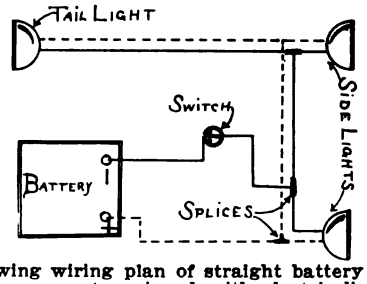


Diagram showing wiring plan of straight battery system of electric lighting for cars not equipped with electric lighting system.

two candlepower bulbs will consume slightly over seven watts. To simplify matters let it be assumed that one ampere is equivalent to six watts, inasmuch as an electromotive force of one volt with a current strength of one ampere is capable of developing an energy called a watt.

If the battery be of 60 ampere-hour capacity, multiply 60 by 6 which obtains 360 watts. As three two candlepower lamps will consume say 7½ watts, dividing 360 by 7½ obtains 48, the total number of consecutive hours of lighting that should be obtained. If six dry cells be used, and estimating the amperage at 20, they will supply lighting for 16 consecutive hours. If dry cells are to be employed, it is best to wire 12 in series multiple as greater efficiency and longer life will be obtained.

Care of the Varnish.

From J. Elton Greenleaf, New Jersey.—When the new owner receives his first car with its beautiful luster, he resolves to keep it in this perfect condition as long as possible. Such a resolve, if conscientiously followed out, will more than repay him for the additional labor which it involves. Automobile bodies are usually finished with at least 18 coats of paint and varnish. All this fine finish is put there by the manufacturer not only for beauty's sake but also to protect the surface underneath from the disastrous effects of the elements. It is most certainly worthy of the greatest care. It would raise the hair on the head of an ordinary coachman if he saw a man go over a car with hot water and a scrubbing brush as has been done in some instances. Such a procedure mars and dulls the varnish beyond any

Digitized by Google

hope of repair without refinishing. In the first place one should possess two chamois skins and two flannel cloths, one of each for the body and chassis, also a plentiful supply of cold clean water. Rain water is preferred, but should none be at hand the ordinary city supply will do nearly as well. Using a hose without a nozzle, direct a gentle stream of water against the body, taking care to have it hit the body at an angle. The more gentle the stream and the longer time any mud accumulation are allowed to soak the better, as a heavy flow will tend to drive the grit over the surface so rapidly as to cause scratches. If a hose is not available, a garden watering pot, such as used to water flowers with, will serve, although not as convenient.

Taking one of the flannel cloths remove the accumulations of dust and mud as the water flows upon the body. Try to float the dirt accumulations off as much as possible without rubbing the surface.

Keep separate chamois and cloth for the body and chassis, and always wash the car in the shade. In drying the body wipe it gently with the chamois and let a fine mist remain as this will notably increase the luster. While there are undoubtedly good soaps on the market for use in washing cars, the writer does not recommend their continued use, except on the chassis. Kerosene should never be used. Plain cold water is the best thing for the varnish, and plenty of it, especially on a new car as it hardens the finish.

First wash the hood, then the body, fenders, chassis and wheels last. In washing the chassis, first remove with gasoline all accumulations of grease or oil. Between the spokes a brush can be used to good advantage. The varnish used on the chassis will stand a much stronger stream of water, without injury, than that used on the body. Care should be taken in lubricating the car, not to spill any lubricant on the varnish as it is very detrimental to it.

Tar deposits may be removed with a small piece of rag moistened in turpentine. Do not allow mud spattered on the car to dry on it, as it will spot the finish by extracting the oil, and wash off dust as soon as possible. If these directions are carefully followed, the car will retain its original luster for a long period.

It Was a Defective Coil.

From F. H. Tuthill, New York.—I note an inquiry in your Trouble Department, No. 1755, January number, 1916, from C. E. Caswell, N. H. I have one of the same model AA Maxwells, and have had just the same trouble described, and did just what Mr. Caswell did, but no good. I concluded it must be in the coil and sent it to the Splitdorf people. They repaired the coil at a cost of less than four dollars. Now my Maxwell AA of 1910 is running fine. This car has been run a little more than 45,000 miles. By bushing the inlet valve stems, no doubt, there would be an improvement in the motor.

Expects to Make 100,000 Miles.

From E. E. T., Iowa.—I have a Warren Detroit, 1910 model car, and it is as good as most cars two years old. I have never run it over 35 miles an hour. I only figure on making 20 miles an hour. I have never had the speed craze. I do my own repairing. My car has only 70 miles to run to make 50,000 miles, and I expect to drive it 100,000 miles. A car needs a careful looking over at least twice a year and cleaned, and if you hear a queer sound look till you find the trouble and fix it.

Hood Support and Pipe Cutter.

From C. S. Perry, Rhode Island.—The streamline or taper hood of the present type of auto is not as easy to handle as the old style which had a support

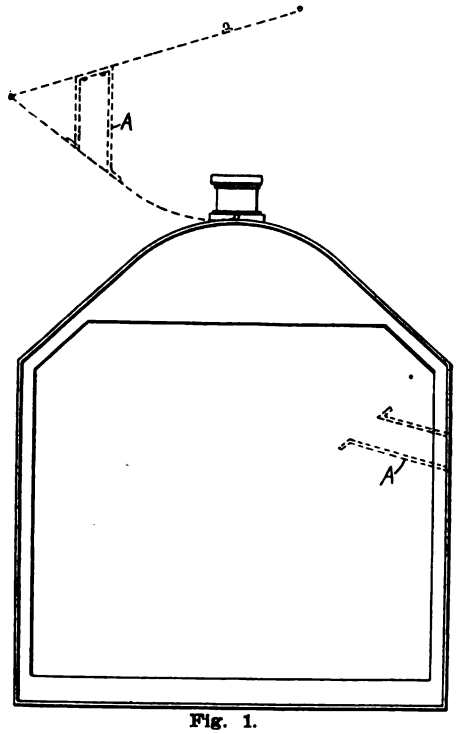

Fig. 1.

attached to the engine side of the dash. With the old type it was an easy matter to raise and fold back the flap of the hood when one was inspecting the engine or adjusting the carburetor, etc. With the new designs one must be careful in raising and folding back the hood else it will scratch the varnish and paint on the body part of the hood. As it is not an easy matter to fold the hood back when looking over the engine, the bracket or support shown at A in

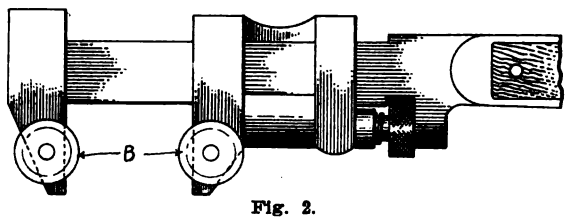

Fig. 2.

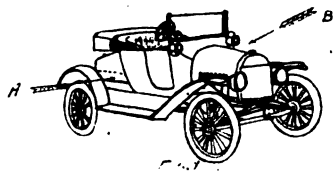
Fig. 1, will be found to be useful. It consists of a strip of light steel about half an inch wide and one-eighth thick and is bent to the shape shown in the drawing. The strip is rivetted to the hood and if one be careful the heads of the rivets will not show or the finish be injured to any great extent. The rivet heads can be touched with a little color varnish after the job is completed. In fitting the hood support, care must be taken to so install it that it will clear the motor when the hood is down. This kink will not only save scratching the paint but the hood can be raised and lowered easily.

The kink shown at Fig 2, illustrates how a pipe

Digitized by Google

cutter can be made by any one interested in manufacturing his own tools. Take any old wrench the jaws of which open wide enough to handle piping, up to 2 or 2½ inches or less, it depending on the work to be done. Purchase the steel cutting discs, B, which can be bought at any hardware store for a few cents. Use two stove bolts with diameters similar to the openings in the discs, and drill two holes in the jaws of the wrench as shown in the drawing. Slip the bolts through the openings in the discs and those in the wrench jaws, and tighten the nuts on the bolts. It is important that the discs rotate fairly free on the bolts. As the jaws of the wrench are adjustable it is a simple matter to cut piping of different diameter up to and including the maximum opening of the cutters.

How a Knock Was Cured.



From Leroy C. Smith, New York.—I have just signed for your paper but have read it for some time. I want to tell the readers of an experience I had with a Ford motor.

I repair cars of all kinds but this one was a sticker. The trouble was a slight knock when the spark was advanced. At all other times the motor ran smoothly. The trouble was to find the knock. I took it to be a bearing knock, of course, and I tightened all the bearings but the knock got worse. I had the motor all down and it seemed to be in fine shape (a 1913 car). I was desperate, so I wrote the Ford Company, but they did not help me any, so I set out to find what the trouble was or bust. I didn't think it could be a piston slap, as the pistons were in such good shape, and seemed to fit the cylinders fine. Every time I started the thing it seemed to knock a little harder, and as a last resort I began to lift out the coils, one at a time, and as I lifted out No. 2 coil—behold! it quit knocking. I at once took out the second piston and fitted a new one .003 inch oversize, and when I started it the knock was gone for sure. I hope this will help some one who has the same trouble, and I would advise every Ford owner to keep watch of his pistons and have new ones fitted when they have been run some time. Let us hear from others through these columns.

Stream-Line and Improved Steering Wheel.

From I. O. Ernest, Mt. Vernon, Ohio.—I own a 1915 Ford runabout. Following a suggestion in the October Automobile Dealer and Repairer, under the heading of "A Compartment for Tire Shoes," by E. G. B., New York, I conceived the idea of giving to my car the up-to-date stream lines. To my surprise this was a very simple matter, and gives to the Ford roadster such a neat classy appearance that it cannot be recognized as a Ford unless scrutinized closely. With the Ford runabout it is a very simple matter to remove the rear boot. I then made a tire compartment 6 inches high as suggested by E. G. B., with the exception that this was made of wood, and in the manner indicated at A, Fig. 1. This consists of a wood frame with the side to the rear of the machine left loose to which a wooden tray is fastened so that it can be slipped in and out like a bureau drawer; then on top of this frame the old boot can be easily fitted. The frame was then given a coat of shellac and two or three coats of black enamel. As will be noted this raises the old boot 6 inches which adds greatly to the appearance as well as giving a great deal more room for carrying baggage, etc., when the tray is not used for a spare tire. I also made the bottom of the old boot removable which adds to the convenience when no spare tire is being carried. I then secured a stream line hood from the Specialty Auto Parts Company, of New York, and the transformation was as surprising as it was complete and pleasing, as will be noted by the cut.

After driving my car just the past summer and fall I found that the paint had worn off the steering wheel rim so much that it made it rather unsightly; also when driving with gloves, especially woollen ones, I had to moisten the palms frequently with saliva to prevent the wheel from slipping in my hands. I overcame these objections in the following manner, which is very simple and costs practically

nothing: Get a yard of heavy unbleached muslin and cut it "on the bias" into strips 1⅛ inches wide, and fold one edge over ⅜ inch, as shown at A in Fig. 2. Remove the rim from the steering wheel spider and tack one end of the strip to same with a small tack. (Drive the tack through the single thickness of the strip as at B so that on the next round it will be covered and not leave a rough place on the rim.) Then wrap around the rim overlapping the single thickness with the ⅜ inch edge that is turned over as at C. This will bind each previous round solid and make the wrappings three thicknesses as well as cover the tacks at the beginning

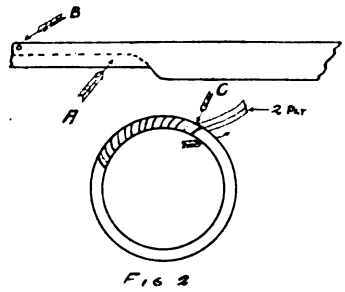


Fig. 2

and end of each strip. After the rim has been covered with the muslin strips give three or four coats of hard floor varnish, or dark shellac and you have a steering wheel improved in appearance, as well as one which will not slip in your hands, which is a factor of safety.

Beware of the Flames.

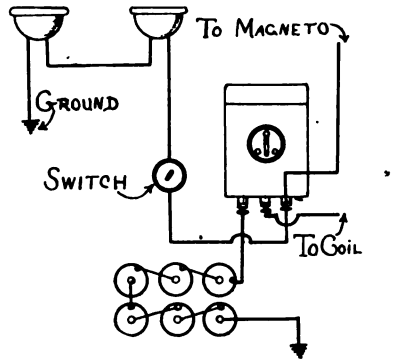
From W. H. D., Connecticut.—A gentleman in Marble Dale, Conn., thought to warm up his Overland so that his daughter could use the car to drive to her school, a mile distant, she being a teacher. He accordingly set an ordinary kerosene oil heater in front of the radiator and put robes and blankets over it and the radiator, and went to his breakfast. Upon returning, dense smoke was issuing from the garage. With the help of a neighbor, the garage doors were forced and the machine pulled out and the fire put out. The fire in the building which adjoined his store was also extinguished. The fire

Digitized by Google

was confined inside and it caught inside under the hood. Everything under the hood was irretrievably ruined, wires were fused, or rather burned off from everything, and the hood was of course ruined. The oil stove was very little injured. Probable expense of repairs, $250.

An Unusual Record.

From W. E. H., South Dakota.—For the benefit of automobile owners and those thinking of owning one, I wish to tell some of my experiences.



I bought a Rambler, No. 63, in 1910, and still have it. A repair book came with the car, and I made a study of every piece and part, so I knew what I had. When it does not sound right, I find out myself what the matter is and fix it myself, if possible. This may sound big, but it is the truth. I have driven this car over 80,000 miles and in all kinds of weather, as I ran an automobile livery for 18 months with it and did nothing else. It still has the same spark plugs in it that came with it, and the same carburetor, except I put on a hot air pipe from my exhaust manifold, since the gasoline has gotten so poor. I have only been hauled in once, and then I stripped my gears on a bad road. I always use steam engine cylinder oil in the transmission and differential. I prefer Polarine to any oil I have ever used in the engine. I see that my oil pump drops 4 drops to each cylinder at a time, or all it will stand, without making it smoke at the muffler. I always set the hand feed so that the engine will run smooth when idling, and then govern it with the foot throttle. I always coast down hill, around corners, over crossings and rough places when possible. I never apply the brakes hard enough to slide the wheels, and never drive over 25 miles per hour, unless necessity demands it. I always use rain water in the radiator, if it is to be had. In cold weather I fill it with hot water, then it starts easy. As far as the engine is concerned, I would just as soon start for New York or California, as with any engine I know of, if I only had a starter. The compression is so strong, my wife can not crank it. It is a 34 horsepower. If you should get a short circuit, and do not know where it is, look at your electric horn, if you have one. I had one and it came against the brass rim of my dash by wear. It took me a day and a half to find it and one minute to fix it when found. I get from 10,000 to 15,000 miles out of a set of tires. I put in an inner liner after I have run them 1,000 to 1,200 miles. I can yet drive my car as low as 4 miles per hour on high. If I was to buy a new car to-day I would first get a book of parts and study them.

Starting the Ford Car.

From M. E., New Jersey.—Much has been said and written about starting the Ford car on the magneto in cold weather. While the flywheel magneto will give enough juice when everything is all right, it is not an easy task to crank sharply after the motor has stood for some time in the cold as the average owner of a Ford will agree. Having picked up a six volt storage battery very cheaply I decided to install it and wire it up with my master vibrator. And as I had the current decided to connect up my headlights so that I could use them when the car was running very slow or when I left it for a few minutes. This saved lighting the side lights. The accompanying drawing shows how the wiring was accomplished, and for the benefit of those desiring to use dry cells, I have shown the method of wiring them.

One of the leads from the lamps is grounded or attached to some metal part of the chassis. One side of the battery is also grounded. The remaining wire from the battery is attached to the left hand terminal of the vibrator, and a wire having a switch in the circuit is led from the right hand terminal of the vibrator to the switch, thence to the headlight.

When the vibrator switch be thrown to the right, the current for ignition and lighting is supplied by the magneto. Placing the switch lever at the left, cuts out the magneto and cuts in the current from the battery as when starting. The lighting switch controls the lamps. By throwing the vibrator switch

Wiring plan for Ford car including dry cells for starting and supplying current to the lamps.

to the battery side one can use the current from the battery for lighting the headlights. While the exact method of wiring may vary with some vibrators, the principles are the same, but in the plan shown the units of the old coil were fixed by what is known as shunting, and the coil switch was placed at the side to which the wire from the vibrators is attached.

Car Thefts in Chicago.

The wholesale theft of automobiles, which has been going on in Chicago, Ill., is shown by the fact that 2,185 cars were stolen during last year. Of these 1,775 have been recovered, and 410 are still missing. The growth in the number of cars stolen each year in Chicago is shown by the following table:

Year	Stolen	Recovered	Balance
1911	617	613	4
1912	678	670	8
1913	557	524	33
1914	1,415	1,284	131
1915	2,185	1,775	410

As a result of skillful detective work, the Chicago police recently captured a number of men who had stolen many cars, and it is hoped that the 1916 figures will show a decrease in automobile thefts.

Anything that tends to push a valve to one side or lift it by applying force in any way except centrally is liable to cause unequal and abnormal wear of both stem and seating. For this reason the end of the stem and the top of the lifter tappet should be true and square and make perfectly even contact.

Automobile Dealer and Repairer

A Magazine of condensed and compact information for busy readers.

Member of the Audit Bureau of Circulations.

PUBLISHED THE MIDDLE OF EACH MONTH BY

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York

Telephone, {7377 / 7378} Barclay — Post Office Box 654

Entered as second-class matter at the Post Office in New York City.

M. T. RICHARDSON, President and Treasurer — F. R. WHITTEN, Secretary

A. A. HILL, Editor

F. R. WHITTEN, Advertising Manager

E. DAYTON, New England States

H. F. LUDINGTON, Illinois, Indiana, Michigan Wisconsin and the West

F. M. DAMPMAN, New York, New Jersey, Pennsylvania, Ohio

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK, FEBRUARY, 1916.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

AUTOMOBILE PRICES.

The fact that one manufacturer of high grade cars has announced an increase of $100 in the price of their six cylinder model beginning with March 1, need not be considered as positive proof that the tendency will be general. The reason given for the advance in the case referred to is the rise in price of raw material, although it must be admitted that the sum referred to would represent quite a stiff "rise" of such raw material as has really advanced in price.

Yet a movement of this sort is better business policy than a superficial glance would indicate, whether or not the rise in price of raw material compels it. An intending purchaser of a high grade car will be likely to assume that if the rise in price is a necessity it indicates that the present price is low for the value given, and likewise that the present demand for the car must be good or the manufacturers would hardly care to take a step that might reduce that demand. Then the announcement was made long enough ahead to give prospective purchasers ample opportunity to get a car that will sell at an advanced price soon after their purchase, it being rather disappointing to purchase a car or anything else only to find that a substantial reduction in price has been made immediately after. It makes one feel that his purchase is not worth what he paid for it.

As to the rise in the cost of the raw material of an automobile, it is both substantial and general, although not enough to add to the cost of the finished product when the constantly improving methods of production are taken into consideration. The tendency to reduce prices during the past year is proof of this. It might be claimed that the abnormal profits of some of the more prominent manufacturers is still further proof, but if profitable war orders be eliminated, automobile manufacturing will not average greater profits than any other business.

As to the general subject of rising prices, it is the surest guarantee of prosperity that can be had. It indicates that the people want things and that they have the means to satisfy their wants. On the other hand, falling prices are a sure indication of falling prosperity.

Nor should there be any apprehension even though the rising prices are due to a lessened supply. No matter whether there be a greater or less supply the price will be low if no one wants to buy or is able to buy. On the other hand, if the people are able to buy and want to buy, the supply will be forthcoming sooner or later, for the price will make it profitable to produce the thing needed.

In this day and generation of marvellous productive capacity there will not be a long period when a supply of anything cannot be had that the public want and have the money to pay for.

Meantime, despite the rise in price of raw materials, we do not look for a general rise in the price of automobiles. Owing to greater efficiency the cost of production falls faster than the cost of raw materials rises.

MISSING COPIES.

In spite of the care with which we mail copies of the Automobile Dealer and Repairer each month to all subscribers, we get a great many complaints. After we have deposited a subscriber's paper in the post office, of course, our responsibility with respect to it ceases, but nevertheless the subscriber holds us responsible and of course makes his complaint direct to us, if he doesn't get his copy regularly. Readers are assured that it gives pleasure, any time a copy is missed, to resend it. All that is necessary is to drop us a line by letter or postal card, stating the month that has been missed, and, unless it is out of print, it will be promptly forwarded without charge.

We want our readers to bear in mind another point, and that is that our paper is not published the first of the month, but the middle of the month, and sometimes it is late two or three days, owing to our big edition. Thus Western subscribers are not likely to get their copies any month much before the 25th, and possibly sometimes a day or two later. Far Western and Pacific Coast subscribers will be still later in getting their copies each month.

This explanation is made because so many readers, in spite of efforts to inform them, are mistaken as to the date of publication.

INDUSTRIAL REGENERATION.

Both England and Germany are considering how to regenerate their industries after the war is over, and each is naturally anxious to wrest from the United States that which this country has gained. France is also giving some thought to the subject. The national feeling in each of these countries is strongly against imports and the popular slogans are: "Sell as much as we can; buy as little as we can; do without as much as we can." According to external evidence or reports, each side feels confident

Digitized by Google

of winning, and this leads to the conclusion that it will be some time before the war is over. If so, there will surely be an imperative necessity for the most rigid economy.

The means suggested for securing this trade regeneration seem to be mainly better organization of industry, the highest efficiency, and the use of more automatic and high speeded machinery. These are well enough, but alone they will not draw away business from the United States.

When that wicked and altogether uncalled for carnage is over, labor in those countries will be more expensive than it has been for many years. One reason for this will be the appalling destruction of their strongest and best workers, both skilled and unskilled. This will amount to at least one-fourth of the whole. Then the demand for labor to rehabilitate industries and replace destroyed property will be heavy. With this increased demand and decreased supply the price of labor is likely to rise at least 50 per cent. This being the probable situation, this country need not for some years fear serious inroads into the trade it has already secured from other countries than those engaged in the war. Of course, our direct trade with the war countries will fall away to a remarkable degree.

DEATH OF JOHN A HILL.

A great light in trade paper journalism went out with the passing away of John A. Hill of this city, president of the Hill Publishing Company, which publishes five technical journals—American Machinist, Power, Engineering News, Engineering and Mining Journal, and Coal Age. Mr. Hill expired in his automobile while on his way to his office, and at the age of 58. Some would say he "died before his time," being in the full flush of physical manhood. But he lived long enough to secure the respect of his acquaintances and the affection of his associates and employes. He also left a business which is a monument to his memory, and quite likely a sufficient fortune to satisfy reasonable ambition. His ideals were high and he spared no effort or expense to reach them; his impulses were generous and many in his employ have felt them; his purposes were plain and there was no guile in him.

John A. Hill was born in Vermont, but went west with his parents in his boyhood. He learned the printer's trade and afterwards became a locomotive engineer. He came to New York and began his career here as an advertising solicitor for a feeble trade paper, but by the force of his tremendous energy soon made it prosper. In less than 30 years he thus rose from obscurity to become the head of one of the largest trade publication enterprises in the world.

The race was nobly won. Why should it have been prolonged? Peace to his ashes!

GRADE CROSSINGS AND DARKNESS.

According to investigation made by the Bureau of Census at Washington, the automobile to-day is being driven with more care and more regard for public safety than it was a few years ago. Thus a five-year increase of 775 per cent.—accepting as reliable the figures compiled by the National Automobile Chamber of Commerce—in number of machines, has been accompanied by an increase of 315 per cent. in automobile fatalities; and a one-year increase of 38 per cent. in number of machines has been accompanied by an increase of 12 per cent. in fatalities.

Judging by our reports, grade railway crossings are now supplying a large per cent. of the fatalities, and of course every such accident is due to pure carelessness. Sometimes the steering gear of a car may get out of order, or the brakes may give way, or the car may skid, and for such defects human foresight cannot be held invariably and wholly responsible. But there is not the slightest reason whatever for any one to drive an automobile upon a grade railway crossing unless he knows positively that no train is near.

Again, far more accidents happen at night than during the day. Few seem to realize the absolute necessity for the great restriction of speed after nightfall. All drivers should make it a rule to see for themselves by the light of their own lamps whether the way is clear or not. No one should ever drive at a speed so that he is unable to pull up to a standstill in less distance than is illuminated ahead by his lamps.

FIXED AND RESALE PRICES.

It is singular that in all the discussion of the bill to allow manufacturers of patented and trade-marked articles to control the resale prices, the matter has been almost altogether considered from the standpoint of the interest to the reseller and the producer only.

Of course it is to the advantage of the producer to control such prices, else why should he want to do so? The fact that low prices often stimulate increased sales weighs very little against the many advantages of maintained prices. If the price of the Ingersoll dollar watch, for illustration, were reduced to 80 cents its sales would without doubt be increased, but once price-cutting is begun, no one can tell where it will end, and lower prices are always a temptation to lower quality on the part of the producer, even though they may not always compel it.

Thus as far as both the producer and the retailer are concerned fixed prices are desirable. In these times when distribution lags so far behind production, price-cutting invariably means disaster if not positive ruin.

As stated, these are the views expressed by the trade magazines and business men. But when they offer these arguments as a reason why a law should be enacted forbidding retailers to cut prices of such articles, fresh evidence is adduced as to how laws often get upon our statute books.

Except as it concerns the public welfare the interests of the retailer and the manufacturer are no concern of our lawmakers. It is simply a case of a few desiring to sell their products at as high prices as possible and of many desiring to purchase at as low prices as possible. If the public had its way manufacturers and retailers would not be allowed to make a fair profit, and if manufacturers and retailers had their way the public would be paying exorbitant profits upon their purchases.

We are inclined to think that the public interests would be best conserved by allowing producers—except in the case of monopolies—to fix resale prices. But let us not sail under false colors. Let us not enact laws to benefit individuals or classes, or special interests. There has been too much of that.

In the case of watches, or cameras, or breakfast

Digitized by Google

foods, or automobiles, if the price of a certain kind is too high, why, the public can do very well with some substitute, and then farewell, a long farewell, to inordinate profits upon the goods named.

THE MELTING POT.

Patriotism is not like a garment that can be put on or thrown off at will. Nor is it like a mushroom that can be dug up after having been sought. It is a development or growth, and if of substantial character it must be inspired by feelings of gratitude to one's country for protection or whatever other amenities government can supply. Material welfare and the possession of a home are perhaps the greatest stimulus to patriotism.

Yet there can be no objection whatever to the movement on the part of certain employers of labor to insist that a prerequisite to employment must be loyalty to the United States government and to the flag. The mandate as laid down is that only employes who are native born or are naturalized citizens, or those who have taken steps to become citizens will be promoted. Employes of foreign birth who retain their citizenship in the country from whence they came will not be discriminated against in their present positions of work but they will not be promoted to positions of responsibility and trust.

Quite likely that kind of naturalization may be better than none at all, but it will not create much patriotism. Naturalization by even the semblance of compulsion, or where the stake is the bread and butter of a man or of his family, will not count for much. The statement that since the rule has been put into effect in Detroit there has been an increase of 50 per cent. in the applications for first papers toward citizenship is more significant that a "job" is at stake than that there is a sudden quickening of patriotic feelings.

But an oath of allegiance means something, and it imposes certain responsibilities and duties. We owe much to our foreign-born citizens, and the melting pot of their children and their children's children, has in the past produced splendid material upon which to build the structure of a self-governing nation.

PROPOSED LEGISLATION.

The forces for and against the proposed automobile regulations in this State which were prepared by Police Commissioner Woods of this city are lining up and a warm contest is foretold. The bills in question are as follows:

First, a provision requiring that all operators of automobiles in the State, whether chauffeurs or owners, shall pass an examination as to their qualifications.

Second, a provision that in cities of more than 2,000,000 inhabitants the Police Commissioner shall be invested with power to revoke licenses of operators.

It need hardly be said that we are opposed to the first named bill. As has often been stated in this magazine, no examination can be made to determine correctly whether a man is capable of driving an automobile or a horse so as not to endanger the public. Some of the best judges of horse flesh in the world are hardly fit to drive one, and men who have the construction and manipulation of an automobile at their fingers' ends are liable to endanger other users of the highways and streets when driving them.

We favor the giving the police force more power over automobile drivers—but not power to take away licenses, for there should be no licenses. Yet they should have the power to arrest all who are driving recklessly or in such a way as to endanger other users of the highways or streets, and the word of the officer making the arrest should be considered not only testimony but evidence as to the fact. Do this, and "make the punishment fit the crime," and the streets and highways will soon be safe.

No matter how much a man knows about a car, he is likely to injure other users of the highways if he is reckless or careless, and no matter how little he knows about one he is not likely to injure them if he is discreet, has common sense and possesses a due regard for the rights of others.

COMMERCIAL CARS.

Within the next year or two more commercial cars and trucks than pleasure cars will be sold for city and town use. Draft horses will soon be a rare sight except where frequent stops are to be made, as for instance, in delivering milk to consumers, or for work on wharves. Automobile delivery has now been demonstrated as far more economical and elastic, and places where light snows come and go in winter the work of the horse cannot compare with that of the horseless vehicle.

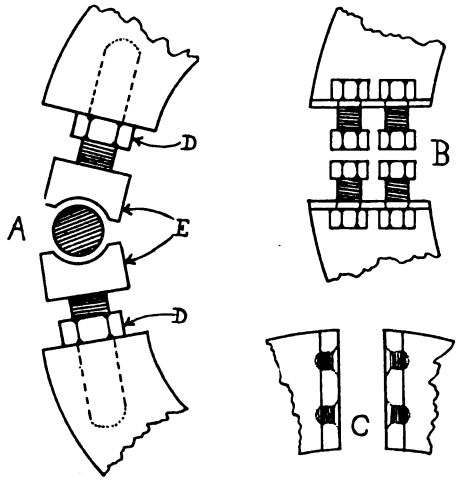
The time is at hand when agents for pleasure vehicles and others should secure the agency for one good line of commercial automobiles. For express and store delivery, and for the miscellaneous work around mills and factories, or for the hauling of freight from railroad stations, horse-drawn vehicles are so much more expensive and inferior in every way that it needs no superior salesmanship to fully demonstrate it.

Our readers who already have the agency for pleasure cars ought to get the agency for commercial cars at once. The sales will be heavy this season, and those who get established first will do a profitable and satisfactory business. Both horses and feed are too high priced to compete with the automobile.

With fair use a commercial car will give less trouble and be less expensive for upkeep than pleasure vehicles. It is high speed that ruins automobiles, and high speed in commercial work and trucking is needless, although of course even the six-ton truck can be driven twice as fast as the gait of the walking draft horse.

There are plenty of chances to secure the agency for reliable commercial cars but the opportunities are too attractive for such chances remaining open long.

Brake Repair.



Although the use of metal-to-metal brakes of the expanding type are confined to older cars they are still employed on one or more modern models. It is not always an easy matter to restore worn brake shoes and their mechanism of this type particularly when the stud on which the shoes pivot, and the expanding cam and faces with which it contacts be worn badly. When these conditions exist the cam must assume almost a vertical line before the shoes begin to grip, and the leverage is considerably decreased. Added to these complications is the lost

Digitized by Google

motion brought about by wear of the pivot end of the shoes and the stud on which they bear.

While it is not always an easy matter to restore the brakes to their original efficiency their operation can be considerably improved by reducing as much as possible the lost motion in the pivot ends and expanding mechanism. And if these parts can be restored to a satisfactory operating condition, the brakes will hold much better as considerably more of the frictional surfaces will be brought into service. When the pivot end is not worn to any great extent and the action of the cam is faulty, the method suggested at C in the drawing is practical. It consists of two steel plates conforming to the shape of the shoes, and of sufficient thickness to compensate for the worn sections. Clamp the plates to the shoes, drill and tap for a flat headed machine screw, and be sure that the heads of the screws are well countersunk.

The method shown at B can be utilized when there is considerable space between the shoes. As may be noted by the drawing it consists of drilling and tapping the cam end of the shoes and fitting hex headed bolts. The last named are held in place by lock nuts, and as the bolts are adjustable the space can be regulated as desired to obtain a maximum expansion of the shoes.

Practical suggestions for restoring worn expanding metal-to-metal brakes to an efficient condition.

When the pivot ends of the shoes and the stud are so badly worn that bushing or building up the stud does not obtain the desired results, the repair at A can be employed. The recessed ends of the shoes are cut off flush and two block members E, are recessed to fit the stud. These blocks are fitted with a threaded bolt by drilling the block and making a drive fit after which a hole is drilled through the block and bolt and parts pinned. The holes in the shoe should be slightly larger than the diameter of the bolts, and the last named are fitted with locking nuts D. The advantages of the construction are obvious. The bolts cannot turn because of their recessed ends bearing on the stud and the threaded sections permit of lengthening or shortening them as may be necessary to compensate for wear. This suggestion is of value when new shoes must be cast, and in making the pattern allowance should be made for the space occupied by the mechanism.

Trouble with the Two-Cylinder Maxwell.

From W. E. C., Connecticut.—I note in your January issue, No. 1755 is experiencing trouble with his two-lunger Maxwell, that he cannot obtain power. If Mr. Caswell has changed the mixture so as to offset the leakage of air past the valve stems he should obtain power, especially when the motor is speeded up. I would advise him to make a careful test of his compression for it is possible that the rings have so moved that the slots are registering. His trouble also indicates faulty ignition although he says he has cleaned the contact points, but has he adjusted the gap? A weak spark will cause the symptoms described, and a thorough overhaul of the magneto and an inspection of its timing may prove beneficial. I do not agree with your writer when he says the cause is due to leakage of air and I think he will agree with me that an enriched mixture or high speeds would compensate for the extra air drawn in. Will be pleased to hear further from Mr. Caswell as I have had some experience with two-lungers. Would further suggest that Mr. Caswell test his valve springs.

Carbon in Exhaust Pipe and Manifold.

From Ford, Rhode Island.—Chas. W. Finney of No. 1751 inquires in your Trouble Department how to remove carbon deposits from the exhaust pipe and manifold of his Ford. If the deposits are what is termed baked on it is doubtful if the method recommended will prove satisfactory. The manifold can be scraped, but a simpler method is to have it burned out by the oxygen process which is not expensive. Tapping the exhaust pipe usually will displace carbon and Mr. Finney should go a step further and clean the muffler for if he is experiencing back pressure it will be found to be caused by the muffler being clogged with soot. It is doubtful if the accumulations of carbon in the exhaust manifold and pipe cause trouble. It is more likely to be the muffler. If Mr. Finney has a cutout he can test for the trouble very easily.

Low and High Powered Cars.

From Geo. S. Boucher, Virginia.—Concerning the comment our North Carolina friend has made on my article in your September issue, in which he states that he can "pull any hill with his Ford that I can pull with my six cylinder car," but fails to give us any idea concerning the speed.

Granting that our friend's experience with motor cars has been (as he claims) very extended, his statement in a manner is correct, as there is very little difference in the pulling qualities of the different makes of cars on low gear when in good condition. The small portion of North Carolina which I have been over has some very bad roads and the Ford would be an ideal car for the roads, and our friend is not to be censured for making the very broad statement concerning the pulling qualities of his car. However, it might be well to ask him just how he would perform on a hill a mile and a half or two miles long, the very best of asphalt roads; but so steep that even the high powered six and eight cylinder cars cannot climb them on high, but have a second speed which gives them easily 30 miles per hour, which is faster than the Ford should be run on level ground. Do you really think that you can climb a hill of this kind at the same speed as the

Digitized by Google

high powered cars? If you do, try it out. I think your idea of speed would be like the little boy who said "There comes a fellow going." I will frankly acknowledge that the Ford car, both in initial cost and tire expense, would suit my income much better than the heavier cars. However, I motor the same as I hunt—strictly for sport, and when a brother motorist blows his signal horn behind me, I will either give him room to pass, or get out of his way. I have tried out the smaller cars, and the sport to me would be the same as shooting a bird sitting. I took a trip last summer of 2,000 miles with three grown people and five children, baggage, tent, folding cots, cooking utensils, blankets and the necessary equipment to live outside. On this trip I did not meet any person who could make a Ford perform as favorably as you say you can; which is speaking very highly both of you and your car.

I have no desire to enter into any controversy, neither am I an expert in handling automobiles, but I wish to extend to you in this article the same courtesy that would be due you should we meet on the road.

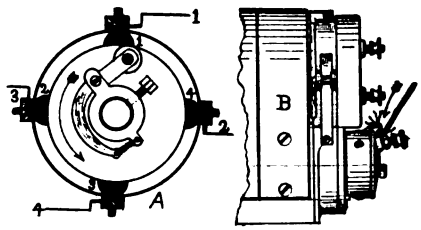
How He Climbed a Hill.

From C. G. Ware, Idaho.—In your December issue I noticed an article written by "W. L. R.," New Jersey entitled "Novel Way to Climb Hills." I experienced the same difficulty that W. L. R. experienced in making a trip to Spokane, Washington, from our town, Mullan, Idaho. One encounters some fairly steep hills through the notorious Fourth of July Canyon, which road one has to make in travelling from any of the Coeur d' Alene towns, by automobile to Spokane.

I was driving a 1914 model Overland touring car, the car belonging to a doctor of Mullan, he being one of the passengers, as was his wife and mine. Everything went lovely until we started up the first and steepest hill on our return trip from Spokane. We had hardly started up the hill when the motor began to sputter and finally died. I immediately knew that the carburetor was too high for the gasoline tank, which is located under the front seat.

Not being able to turn around and back up the hill, I began to study how I was to get gasoline into the carburetor. An idea struck me that if I could get a little air pressure into the tank I could get the gasolene into the carburetor.

I raised the cushion, which, by the way, is divided in the front seat of this particular car, and blew into the vent hole in the filler cap of the gasoline tank, all that was possible for me to blow, using a match, which I had previously pointed, for a plug. I plugged the hole to prevent the air from escaping. I replaced the cushion and was ready to proceed, which I did to the top of the hill, which is about a mile long, without another stop. On arriving at the top of the hill I improved our system of forcing air into the gasoline tank.



Having a doctor with us I asked him if he had such a thing as a piece of small rubber hose with him. As luck would have it, he had a stethoscope in his pocket. From this we took a piece of tubing, one end of which connects with the stethoscope. The other end is put into the car. We then raised the cushion and placed one end of the tubing over the vent hole in the filling cap.

The doctor sat on the seat by my side and when we came to a steep hill he would blow through this tube into the gasoline tank and we made all the hill without any more trouble.

The above may be of some interest to the readers of the Automobile Dealer and Repairer, especially to doctors who carry stethoscopes in their pockets, and contemplate climbing steep hills. By this system there is no waste of gasoline, and the motor runs normally, which is not the case in Mr. W. L. R.'s system. Where there is no tubing available, the first system works very satisfactory as one blowing up of the gasoline tank will run the car a long distance.

Ignition Troubles.

Much of the ignition trouble, particularly puzzling, intermittent skipping of the motor, could be avoided if the owner when replacing old wires with new, or cutting off an end of a worn wire, would use copper terminals and solder the bare end of the wire to the terminal. The fact that the wire utilized is made up of a number of tiny strands of fine copper invites opportunity for trouble if all of these strands are not gathered together and held firmly by solder. This is not news to the average motorist but a large number will not take the time or go to the trouble of soldering. Generally they are content to roll or twist the strands and trust to luck. It is equally as important to solder the primary wires as the secondary.

Illustrating cause of intermittent missing of engine and proper method of rewiring timer.

The reason for the wires working loose is because when 20 or 30 fine wires are twisted together they form a cushion, and when the nut is apparently set up tight it will not always remain so as the bulk is reduced by the pressure of the nut. The vibration is a factor, and in a short time one or more of the strands will untwist from the bunch. This unloosening is aided on timers by the moving of the commutator as when advancing and retarding the spark in operation. When one of these little hair like pieces of copper comes in contact with the metal of the timer, part or the whole of the primary current is diverted, for it must be borne in mind that electricity like the schoolboy, takes the shortest cut home. If the strand is moved in and out of contact by the vibration of the car, the skip is puzzling.

Many alleged magneto troubles are due to careless attaching of the ground wire to the breaker box of the magneto, and the drawing at B shows how the primary current may be grounded or shortcircuited. As may be noted, the strands are in contact with the metal of the breaker box, preventing the primary current from flowing to the secondary winding of the instrument or to the induction coil when the magneto is of the low-tension type. As the binding post or terminal on the breaker box is utilized for connecting the wire that grounds and thereby stops the operation of the motor, in that the supply of cur-

Digitized by Google

rent to the spark plugs is cut off, it should be fitted with wire having a soldered terminal.

In rewiring the conventional type of timer as shown at A, it is a good plan to so attach the wired terminal that the wire will move with the commutator and not bend, or in other words, the terminal should be so located on the threaded post that the movement of the wire will not exert a flexing movement near the terminal section of the wire. The shank of the terminal should be bent slightly outward to avoid the possibility of its coming in contact with the metal of the timer when the last named is fully advanced.

The drawing is also of value to the owner who attempts to rewire without relying upon colored wires to locate the correct terminals. The use of colored cables is satisfactory when they are new but after they have become discolored by oil and dirt, they are useless. The better method is to understand the firing order of the motor and direction of rotation of the shaft actuating the roller or contact member. The firing order of the motor is indicated by the figures on the wires in the drawing and it is 1-3-4-2. The segments or contacts of the timer are marked 1-2-3-4. As may be noted, the wires are attached according to the firing order, consequently, 1 goes to 1, 2 to 3, 3 to 4, and 4 to 2. If the firing order of the motor be 1-2-4-3 as on the Ford car for example, the order of connecting the wires would be as follows: 1 to 1, 2 to 2, 3 to 4, and 4 to 2. The last figure of the pair indicates the coil connection and consequently the cylinder.

The drawing will also be of value in replacing a timer where it is not located in position by means of a pin through the timer shaft. When a set screw is employed for securing the roller mechanism to the timer shaft, fully retard the spark, and with the piston of the No. 1 cylinder at top dead center of the completion of the compression stroke, secure the timer mechanism as shown in the drawing, with the roller just making contact with the No. 1 segment. Some owners scratch the figures 1, 2, 3, 4 on the fibre of the timer for identification. In replacing the timer make sure that the set screw is set up snug, and it is a good plan to test its tightness after the car has been run a few miles.

LESSONS FOR DRIVERS.

Carelessness and Ignorance Responsible for Most Accidents.

Dazed by Headlights.—While driving on the car track, near Battle Creek, Mich., the driver became confused when the headlights of an interurban car struck him and instead of turning to the right he turned to the left and met in a head-on collision. As the cars were going slowly, serious accident was avoided. Passengers were cut and bruised but otherwise were uninjured.

Gates Out of Order.—A woman was hurled from the car in which she was riding and instantly killed and the driver was severely injured at Chicago, Ill., when the car was struck by an elevated train, which runs on the surface at that point. As the gates were out of order the flagman states he signaled to the driver, but the driver saw no signal and witnesses say he made none.

Riding with Curtains Up.—An accident occurred near Waurika, Okla., in which a man and his wife were instantly killed when they were struck by a passenger train. It is believed that they were riding with the curtains up on the automobile and they were unaware of the train's approach.

Head Out of Door.—A man was killed near Closter, N. J., when the car in which he was riding gave a sudden lurch, which caused him to thrust his head through the glass in the door. Before he could draw his head out of danger the automobile grazed a telegraph pole and his head was crushed. The chauffeur was unaware of the injury to his passenger and sped on.

Enveloped by Fog.—Owing to a dense fog which obscured the light of an approaching automobile, an old man was knocked down and injured at Kansas City, Mo., just as he alighted from a street car and started to cross the street. He died on the way to the hospital.

A Careless Crossing Accident.—Two farmers lost their lives in an automobile accident near Humboldt, Ia., when they were struck by a passenger train. There were three men in the party; the accident occurred in daylight and it is stated that the tracks for a considerable distance in each direction are unobstructed. One of the victims was instantly killed and the other died in a few minutes.

Dashed Off Docks Into Deep Water.—A young man was taken from Lake Michigan, near Sheboygan, Wis., nearly frozen to death, and his companion's body was found far from shore. The survivor states that they dashed down the street at the rate of fifty miles an hour into the deep water.

Engine Went Dead.—Three young girls were killed and a fourth injured at Alvo, Neb., when the car in which they were riding was struck by a passenger train. The driver who was seriously injured said at the hospital that the engine went dead on the track.

At a Dangerous Turn.—Near El Paso, Texas, two men were killed when the car in which they were riding skidded on the soft sand at the side of the road when the driver attempted to negotiate a sharp curve. They were going at such a terrific speed that when the car struck the railroad tracks it turned completely over, both occupants being buried beneath, sustaining injuries from which they died in a few minutes.

Skidded Off Embankment.—A man died from the effects of injuries received in an automobile accident and the driver was severely injured at Colfax, Wis., when the car in which they were riding skidded over an embankment. The men were out in a snow storm, and the driver thought he could make the turn in the road successfully.

Caused by Broken Steering Knuckle.—Near Louisville, Ky., a man received serious injuries when his automobile plunged down a 40-foot embankment. As the automobile neared the bridge the driver lost control of the machine, because the steering knuckle was broken. One man was thrown from the car and the other was held by the steering wheel.

Driver Kills and Speeds On.—A boy was run down and killed at Detroit, Mich., by an automobile going at a high rate of speed. It is said when the driver discovered what he had done, he looked back, speeded up his engine and disappeared. The boy had been laboriously picking coal from around a steam shovel, and was struck as he stepped from the curb to cross the street.

Power Fails on Grade.—Three women were killed and two men were injured at Grantham, Pa. The

Digitized by Google

party had crossed the railroad tracks and were on the grade when the driver tried to shift his gear to mount the hill. His power failed and the car backed onto the tracks and was hit by a freight train. The women who sat in the back seat were crushed. A two-year-old baby carried by its mother was only slightly bruised.

Cost Is Less as Load Increases.

From N. G. Near, New York.—It is generally conceded that it doesn't cost as much, per unit, to do things on a large scale as on a small scale. In New York City, for instance, the New York Edison Company sells current to run motors at a much lower rate than to private citizens for lighting houses. When goods are hauled in "carload lots" it costs less per pound than when a single pound is shipped. In nearly every phase of life that rule exists and that is why many men have become rich—they have arrived at the point where they can buy in carload lots and sell at retail, or can ship in carload lots and sell retail at the other end. They have an admitted advantage over their smaller competitors, and it is difficult to show that such an advantage should not exist in the face of the rule just cited. The automobile people are guilty of following the same rule in cost price of carrying capacities of gasoline motor trucks.

I have done some figuring along this line and find, as is inevitable, that the smaller the truck the greater the cost per pound capacity. For instance, the chassis for carrying 500 pounds sells at an average of 86 cents per pound capacity. The one-half ton truck is a little less expensive, in accordance with the rule, and sells at 77 cents per pound capacity.

Jumping to the higher extremes I find the 4-ton truck to sell as low as 44 cents per pound capacity, and the 6 and 7 ton trucks at 38 cents and 34 cents, respectively. The 500 pound truck therefore costs a little over two and one-half times as much as the 7-ton truck per pound capacity. It would take 28 trucks of 500 pounds capacity to carry 7 tons and 28 drivers would be required instead of one. The cost of fuel, lubricant, storage, upkeep—everything—would be greater with the many trucks in place of the one.

There is nothing really new about these statements for American railroads have long recognized the economy of large capacities. That is why freight is carried at a lower rate per pound in the United States than in other countries where wages and other expenses are considerably less.

To be sure it wouldn't pay you to buy a 4-ton truck for hauling one-ton loads only. Nor should light trucks be overloaded. A truck, no matter what the capacity, never looks right to me when running along empty or with a light load. I should say, then, that the best truck to buy is the one that can be "kept loaded" to capacity or nearly to capacity at all times. It is always well to remember, though, that the first cost of high capacity is the least.

Tire Sizes.

"Work toward simplifying the number of tire sizes has made very satisfactory progress, as any one who remembers the jumble of a few years will agree," says E. R. Hall, member Standards Committee of the S. A. E. "At one time some companies listed and provided as many as 51 distinct sizes of tires for automobiles. In those days tires cost the consumer much more than they do now—and that was one of the reasons why. Equipment to make so many tire sizes cost a great deal of money. Then, too, in the years when so many sizes were called for there was less scientific knowledge than now of carrying capacities, and individual fancies were sometimes consulted as much as practical requirements. At any rate, the jumble became so pronounced that finally the tire makers and the Society of Automobile Engineers undertook a simplification. There were many obstacles in the way at first, but very gratifying success has been the final result.

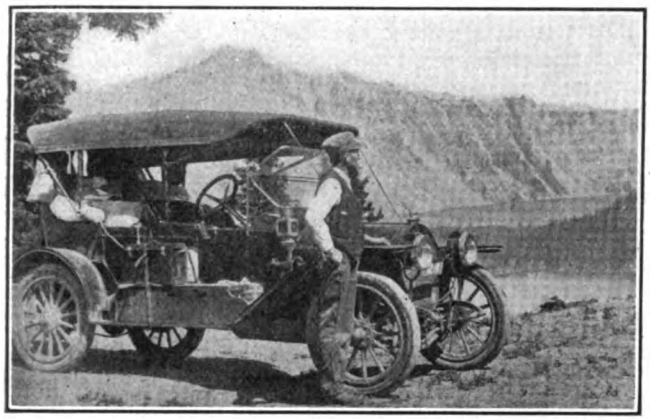
"The S. A. E.'s standard list now contains only nine sizes—with nine oversize profiles to correspond. They are:

Standard.	Oversize.
30 x 3	31 x 3½
30 x 3½	31 x 4
32 x 3½	33 x 4
32 x 4	33 x 4½
34 x 4	35 x 4½
34 x 4½	35 x 5
36 x 4½	37 x 5
36 x 5	37 x 5½
38 x 5½	39 x 6

"It is found that this list comes close to satisfying present-day demands. It certainly has greatly simplified the tire business, for the tire seller and the consumer."

Calendar of Shows.

February 19-26—Harrisburg, Pa., show.
February 20-27—Grand Rapids, Mich., show.
February 21-26—Louisville, Ky., show.
February 21-26—Omaha, Neb., show.
February 21-26—Syracuse, N. Y., show.
February 22—Los Angeles, Cal., speedway race.
February 28-March 4—Indianapolis, Ind., show.
February 29-March 4—Sioux City, Ia., show.
February 29-March 4—Fort Dodge, Ia., show.
March 4-11—Boston show.
March 8-11—Davenport-Rock Island-Moline show.
March 8-11—Mason City, Ia., show.
March 9-11—Kenosha, Wis., show.
March 20-25—Twin Falls, Idaho, show.
March 21-25—Deadwood, S. D., show.
March 22-25—Saginaw, Mich., show.
April 10-15—Seattle, Wash., show.



Races.

May 6—Sioux City, Ia., speedway race.
May 13—New York, Sheepshead Bay speedway race.
May 20—Chicago speedway amateurs' race.
May 30—Indianapolis speedway race.
June 10—Chicago speedway race.
June 28—Des Moines, Ia., speedway race.
July 4—Minneapolis speedway race.
July 4—Sioux City speedway race.
July 4—Track meet, Couer d'Alene, Idaho.
July 15—Omaha, Neb., speedway race.
August 5—Tacoma speedway race.
August 18-19—Elgin road race.
September 4—Indianapolis speedway race.
September 9—Des Moines, Ia., speedway race.
September 15—Indianapolis speedway race.
September 29—Track meet, Trenton, N. J.
September 30—New York, Sheepshead Bay speedway race.
October 7—Omaha speedway race.

an idea of our camp and of the scenery 1,000 feet above the rim of Crater Lake. My wife and daughter were with me.

HANDLING GASOLINE.

Result of Tests Made by G. A. Burrell for the Bureau of Mines.

In connection with investigations regarding safety and efficiency in the use of petroleum and its products, the Bureau of Mines has made numerous tests of gasoline and kerosene, and in Technical Paper 127, by G. A. Burrell, states the hazards that may result from handling these liquids and the precautions to be observed.

Gasoline vapor mingles with air in the same manner that water vapor does, the amount carried depending upon the temperature of the air and the readiness with which the vapor can be obtained. If one takes the cover off a full pail of tightly inclosed gasoline and applies a match to the surface, the gasoline will flare up and burn as long as the gasoline lasts. On the other hand, if one puts a few drops of gasoline in a small, tightly inclosed pail, waits a few minutes and then produces a flame or an electric spark, a violent explosion wlil likely result. In the first case the vapor burns as fast as it comes from the gasoline and mixes with the oxygen of the air; whereas in the second case the oil vaporizes in the pail and mixes uniformly with the air to form an explosive mixture and upon ignition, explodes. One gallon of gasoline when entirely vaporized, produces about 32 cubic feet of vapor. If a lighted match could be applied to pure gasoline vapor in the absence of air, no fire or explosion would result.

At ordinary temperatures air will hold from 5 to 28 per cent. of gasoline vapor, depending upon the grade of gasoline. The author found that in 100 parts by volume of air and gasoline an explosion would not take place if there were less than 1.4 parts of gasoline or more than 6 parts. In other words, the explosive range is between 1.4 and 6 per cent. of vapor. Flashes of flame will appear in mixtures containing considerably smaller and larger proportions of vapor and considerable pressure will be developed, but propagation through the mixture will not take place. One gallon of gasoline can, under ideal conditions, render 2,100 cubic feet of air explosive.

When benzine, gasoline, naphtha and other inflammable liquids are employed, care should be taken to see that the smallest practicable quantities are used and that these are handled in an approved manner. No open light or flame of any kind, nor any machine or belts capable of producing a spark should be allowed in a room where the gasoline is used, all shafting or machines with belts that are liable to cause a static spark should be well grounded and only incandescent electric lamps should be used, these being provided with guards to prevent being smashed. All switches, fuses, etc., should be outside the room. Danger signs should be posted on all doors opening into the room, warning against the carrying of open lights inside.

When large quantities of inflammable liquids are used, the main supply should be stored in a metal tank buried under ground at a safe distance from the buildings. The working supply should be pumped into the building as needed and so arranged that when the pump is stopped all liquid in the pipes will flow back into the supply tank, and the gasoline barrels should be stored in the open air with the bungholes down. Rooms in which explosives or dangerous gases or vapors are used or generated, should be provided with an improved system of ventilation; as gasoline vapor is heavier than air, a suction fan will insure proper ventilation.

There are two principal methods of extinguishing burning liquids: (1) To form a blanket of gas or solid material over the liquid and cut off the air supply; (2) to dilute the burning liquid with a non-inflammable extinguishing agent that will mix with it.

Water may be used for extingiushing liquids such as denatured alcohol, wood alcohol and acetone, that are miscible with it. If such a liquid as gasoline, which does not mix with water, catches fire, the application of water produces little or no effect except to spread the burning liquid. However, the application of a large quantity of water to a small quantity of burning oil, by its cooling effect, may aid in extinguishing the fire. Among materials used to form a blanket of gas or solid material over the burning liquid may be mentioned sawdust, sand,

Digitized by Google

carbon tetrachloride and the so-called foam or frothy mixtures.

The efficacy of sawdust is due to its floating for a time on the liquid and excluding the oxygen of the air. Sawdust itself is not easily ignitible, and, when it does ignite, burns without flame. The character of the sawdust and its moisture content is of little or no importance. It may be well handled for extinguishing small fires when just started, by means of long-handled wooden shovels. Sand probably serves about as well as sawdust for extinguishing fires on the ground, but is heavier and more awkward to handle. When thrown on a burning tank, it sinks, whereas sawdust floats. Carbon tetrachloride, the basis of various chemical fire extinguishers, when thrown on a fire, forms a heavy, non-inflammable vapor over the liquid and mixes readily with oils, waxes, etc. The vapor is about five times as heavy as air, and its success depends largely upon the skill of the user. If liquid in a tank is on fire, the height of the liquid is important. When the liquid is low, the sides of the tank form a wall which retains the vapor, but when the tank is nearly full of highly volatile liquid like gasoline, only the most skilled operator can extinguish the fire.

Care in Driving.

From G. Elton Greenleaf, New Jersey.—Often times one sees drivers turning corners at high speed. Even when this does not actually cause the car to skid, it produces a detrimental strain on the side walls of the rear tires and if they are not properly inflated will very likely cause a rim-cut. And just imagine what a strain is put on the wheel bearings both front and rear by that very force which tends to slide you side-wise from the seat. With wood wheels it is conducive to loosened spokes, as a wood wheel is weakest to withstand a blow or other stress against its side.

Quick starts and stops are likewise to be avoided if the owner is desirous of sparing his pocketbook. Sudden starts throw tremendous strains on all the driving members, as, for example, the gears, propeller shaft, and driving axles, besides breaking down the fabric of the rear tires. For similar reasons, sudden stops should never be indulged in, except in case of emergency and then the car can be stopped more quickly by not applying the brakes with such force as to slide the wheels. This is not remarkable when one considers that in stopping with the wheels locked, the braking force is solely dependent on the friction between the road and tire; whereas, by not locking the wheels the braking force is dependent on the brake lining against the drums, which contain vastly more surface than is against the tire.

Another place wherein a saving can be made is in fuel consumption, if your car is equipped with a dash adjustment for your carburetor. There are two types of these adjusters; one either diminishes or increases the supply of air, the other changes the gasoline adjustment. A motor which is idling consumes considerably more gas than when pulling the car on the level. By changing the air or gasoline adjustment so that you get the maximum amount of air or the minimum of gas which the motor will consume without "missing" at a speed of 25 or 30 miles per hour on a level road, the gasoline consumption will be greatly reduced. It will probably be found that with this changed adjustment, the motor will not idle nor have power on hills, but this can be remedied by simply changing the dash adjustment until the motor runs smoothly.

Care should be exercised in driving motors which have been run for many thousand miles, not to let them knock on account of having the spark advanced too far. This is one of the most common abuses which a motor car has to undergo and also one of the most injurious because it overstrains the bearings and connecting rods.

TWO-CYCLE ENGINES

Given a Fair Chance for Automobiles and Found Wanting.

From Victor W. Page, Connecticut.—The writer has been very much interested in the discussion that has been running in your columns for several issues on the subject of two-cycle engines and their adaptability to present day automobile requirements. In the last issue Mr. Duryea takes exception to the technical skill of practical experience of some of the authorities you quoted and another one of your readers also pleads for the two-cycle engine. The writer does not in any sense of the word, pose as an authority, though if a thorough familiarity with the workings of the automobile since the infancy of the industry will fit a man to be an authority, then I must insist that any of the quotations you have taken from my book, "The Modern Gasoline Automobile," are founded on a practical experience and not merely a theoretical knowledge as some of your readers seem to believe. It has always been Mr. Duryea's great failing to adhere to his own ideas and not to recognize those of contemporary practice. No one will question his great knowledge of automobile construction; in fact, Mr. Duryea was riding around in a practical automobile or rather a self-propelled vehicle at a time when the writer was in knee pants trundling hoops. The fault with Mr. Duryea's reasoning is not that he is not thoroughly capable, both theoretical and practical, but that he does not keep his reasoning abreast of the times and is apt to lay undue stress on his own experience, disregarding that of other engineers of nearly as much experience as he has had in the automobile industry. Mr. Duryea is very much of an idealist and has always had the courage of his convictions. One who judges the progress and development of the automobile industry must do so by considering contemporary practice and not the opinions of any one or two men no matter how brilliant they are. No one will question that the two-cycle engine is a practical form and well adapted for certain classes of work. The fact that it has been generally abandoned by everyone who made two-cycle engines in favor of the four-cycle principle must convince any one who is unprejudiced or unbiased and who has no hobbies of his own to ride, that there must have been an underlying reason for the abandonment of the two-cycle form. I believe that the majority of your readers will concur with you in your opinions and I, for one, am willing to wager a substantial sum of money that a two-cycle engine cannot be produced that will be twice as efficient as a four-cycle engine of equal piston displacement. Theoretically, the two-cycle engine should be twice as effective—in practice the reverse is the case and it is seldom that one obtains more than 50 per cent. increase in efficiency even by going to the complications of using distributing valves and differential piston arrangement to

Digitized by Google

eliminate base compression. The writer is no novice in internal combustion engineering by any means and has given the two-cycle a thorough try-out in both the air and water-cooled forms. In fact, the writer has owned a two-cycle automobile and has had an opportunity of becoming thoroughly familiar with several two-cycle engined machines of earlier days. The two-cycle engine does not have the effective range of speed and the smooth power output that a four-cycle engine has. It cannot be throttled down so low nor can it be speeded up as high as a four-cycle engine. Its exhaust cannot help but have a pronounced odor because it is almost impossible to obtain a good, clean combustion when part of the inert products of a previous explosion are retained in the cylinders.

The writer is, by no means, prejudiced against the two-cycle engine and if any one would design a two-cycle engine that will perform as well as the average four-cycle and will be as reliable and not so susceptible to mixture variations as the two-cycle engines of present-day construction are, I would be one of the first ones to use this type of engine. The fact of the matter is that in all my experience, which not only includes repairing, but construction and block testing of engines of various types, I have always found the two-cycle engine wanting in some respects and in no case as satisfactory as the four-cycle engine which is at present universally used.

Mr. Duryea likens the distrust of the two-cycle principle to that that exists against the air-cooled or direct radiation principle. No one will contend that air-cooled engines are not practical. The writer has built air-cooled engines that would run on a block for hours in a steam-heated room without any signs of distress. No matter how carefully an air-cooled engine is built, however, it is not as enduring as a water-cooled engine and it is more apt to get noisy in service. It is difficult to keep the valves ground in properly and the cylinders are also prone to carbonize more than in a water-cooled engine. These are difficulties of a practical nature and will be evident to all who have had any wide practical experience with the air-cooled form. There is an old and trite saying that "Proof of the pudding is in the eating" and surely no one can question the evidence when it is indicated by so preponderous a majority of motorists and practical engineers opposed to both the two-cycle and air-cooled principles.

Mr. Duryea Still Adheres.

From Charles E. Duryea, Pennsylvania.—I have just read Mr. Near's remarks on the 2-cycle engine and call attention to the fact that he does not tell us how it is "shown mathematically that the 4-cycle should be more efficient." My belief, based on my experience, is that if the 2-cycle does not let fuel escape through the exhaust ports it will show a much higher economy than the 4-cycle for reasons I have heretofore stated, viz: It expands as far as it compresses, uses a constant compression instead of variable with throttle opening, and has far less internal friction and less work of valves and cam shaft to overcome. I am quite curious to see how anybody is going to "mathematically" or any other way show that these things are not in its favor. That most 2-cycles do waste fuel, I admit. That if both engines are tested at maximum power the 2-cycle will waste fuel most likely, but maximum power is not normal in auto work.

His air-cooling arguments are equally faulty. We condense steam to get a vacuum behind the piston and thus get more power. Nobody thinks of using a water jacket on a steam engine. On the contrary, we jacket the cylinder to keep it warm, and often steam jacket it. Both types are heat engines and one cannot waste that heat by warming water and have it also to drive the car. The usual water-cooling keeps the cylinder too cool. This is why the air-cooled cars show an efficiency far higher than the water-cooled ones. That water is a better conductor of heat than air proves nothing. Metal is still better. Many a farmer boy has had his tongue frozen to a frost-covered wagon tire that he tried to lick, but never to an icicle hanging alongside. Metal radiating fins will get the heat away faster than is necessary. The only trouble is that people "know so much that is not so" and will not learn the facts.

STEERING CONNECTIONS.

Useful Information About Lubricating the Two Ball Joints.

Some cars with otherwise proper provision for lubricating the steering joints, especially foreign

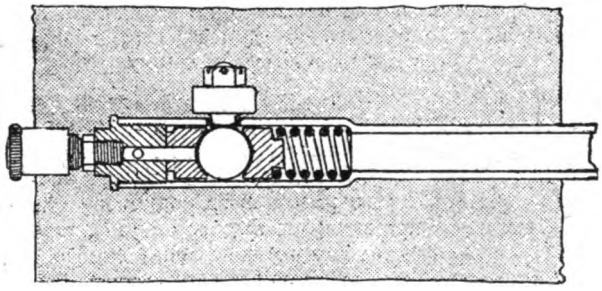

Fig. 1—Sectional view of the front end of the push-and-pull rod, showing the greaser in the cap and the holes drilled through the cap and thrust block to convey the grease to the ball joint.

cars, have none for the two ball joints of the rod from the steering box lever to the front wheels, which, in lieu of a better term, we call the push-and-pull rod. These joints are usually packed with grease when put together, and the leather gaiter over each is also grease packed. This is all very well for a few weeks, but when it comes to re-lubrication the job is a filthy and unsatisfactory one at the best. Although the leather covers keep out the worst of the dirt, a considerable proportion is bound to work in, and it does, so that when one opens them one finds them more or less full of grit and grease. Any attempt to introduce new grease into such portions of the ball joint as can be got at from outside is more or less futile because of the grit, so that the only remedy is to take the two ball joints to pieces, clean up all the parts carefully, grease them and put the things together again, finally replacing the leather covers. However, this is much too lengthy a job to take on lightly, and in nine cases out of ten it is not done, the motorist contenting himself by taking off the leather bags and putting in a little more grease.

It is difficult to imagine a more unsatisfactory happy-go-lucky system of lubrication than this, and on a car which is always kept in the pink of condition we decided to make a good job of the ball joint lubrication, so we took down the steering, and, after

Digitized by Google

having thoroughly cleaned it, fitted a small grease lubricator to each plug nut. This merely meant drilling and tapping the plug nut. Then there was the question of getting the grease into the ball joint. This was effected by taking out the cup, softening it, drilling a hole through it, and re-hardening it. All that is now necessary to keep the steering properly lubricated is occasionally to fill up the lubricator at each end with thin grease and to screw it home.

It will be found on examination of the push-and-pull rod that the spring behind the cup at each end is at the back. The result is that the lubricator for the front ball joint merely has to pass through the plug nut and the ball cup, as shown in Fig. 1, but at the back joint it has to pass through the plug nut, then right through the spring chamber, finally issuing through the cup, Fig. 2. It might be imagined that this would necessitate quite a pressure of grease in the chamber before it would issue from the cup, but this is not the case, as in putting the steering together one fills up the spring chamber with grease, and the slight movement of the spring when the car is in use on the road acts almost like a pump, and the result is that the back joint is lubricated even better than the front.

It will be seen that the only objection to this system is that only one-half of each cup and ball joint is lubricated direct from the screw-down greaser, but we have not found in practice any objections to this, as the fact remains that clean grease is fed into the joint, and it soon works round to the other side of each cup. If, however, one desires to be doubly sure one can take a leaf out of the book of the designer of the Guy lorry, and can have a little channel ground in the ball right round to the other side.

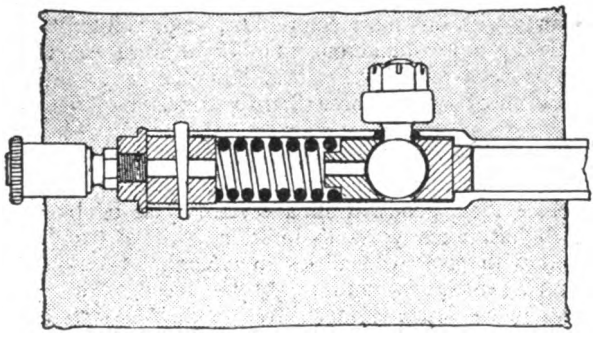

Fig. 2—The back end of the push-and-pull rod with the greaser fitted to the cap. The grease, it will be noticed, has to pass through the spring to reach the ball joint.

To make a success of the job it is necessary to bear in mind that thin medium grease should be used, and nothing of a hard stodgy nature. It is also a fact that once lubricated in this way the joint keeps in splendid trim for very long periods, and it should be noticed that the lubrication is always outward; that is to say, when the grease exudes, it pushes out grit, whereas with the old arrangement of external replenishment all one could do was to push grit in with the grease.

It may be interesting to add that when we took the joints down we found that they were in excellent condition, despite the fact that they were lubricated with a mixture of grit and grease, which had, however, resulted in there being some evidence of scoring. But what we confess rather astonished us was the fact that we found the proper lubrication of these two joints, which at their worst were very far from dry, very greatly improved the steering. We were very careful not to touch any of the other lubricators before making a test, as if we had gone over the whole steering we should naturally have ascribed the improvement to the fact that we had screwed up all the lubricators.

This brings to mind a little dodge that many old motorists know; that is, if at any time the steering become sluggish and is known to be properly lubricated so far as the supply in the lubricators is concerned, it is well to jack up the front wheels and then to refill and screw up the steering pivot lubricators. Having done this, turn the steering backwards and forwards a few times and let the jacks down again. There is no doubt that when the weight is on the wheels the grease sometimes fails to penetrate to the entire bearing surface of the pivot pins, but the relief afforded by jacking up permits it to get all round the pins, and enables the steering to be made perfectly free again for some considerable time.

NOW CLEAN THE CAR.

And Thus Put It in Shape for the Spring and Summer Work.

Fine weather will soon be here. Get ready for it by cleaning up your car. Clean underneath and wash the mud out of the frame channels. Clean up the engine with an oiled rag, removing the mud, grit, excess grease, etc. Clean out the compartments under the seats, brushing any dirt or rust which may have accumulated out of the tonneau and driver's compartment. Clean out the door pockets. In a word, remove all mud, dust and excess grease from all parts of the car.

Drain the cooling system, removing the drain plug from radiator, water pump or radiator intake pipe, according to the model. If it is a pet-cock, remove it entirely so as to give free drainage, and flush out the entire system with a hose. It is well to put the hose in the filler of the radiator, wrap a rag around it and force water in under a slight pressure, so as to get all the sediment washed out of radiator and water jackets. After this, close the drain hole and fill the system with clean water.

Drain the oil out of the crank case, clutch case, transmission case and rear axle, and wash all of these parts with good, clean gasoline or kerosene. After thoroughly washing these various cases put the drain plugs back, insuring that they are screwed in tightly, so that they will not work out, and fill the various compartments with fresh, clean lubricants. The crank case should be filled to the upper try cock with any first-class cylinder oil of about the consistency of Mobiloil BB, or with Polarine Heavy.

Thoroughly clean the clutch and transmission. See that there is no back lash in the steering gear. Better take the car to some good garage to have the carbon burned out of the cylinders, if they are carbonized. If the valves are in fair condition, let them alone.

Look over the ignition system for loose terminals, examining the wires for chafed spots. Tighten up any loose terminals, and if you find a wire chafed wrap it with a piece of friction tape. Go all over the

Digitized by Google

car and feel every visible nut, bolt and screw with a wrench or screw driver, and if any loose ones are found tighten them up. Pay especial attention to the spring clips, because they are likely to have worked loose and to require tightening. Be sure that the body bolts are tight. Examine all water and oil connections for leaks, and if they are found be sure and stop them, because water leaks mean that you will have to fill the radiator oftener than necessary, and oil leaks mean that you are using an unnecessary amount of oil. The gasoline system should be filled and looked over carefully for leaks.

Finally, start the car and drive it for a few blocks, preferably over cobble stones, and hunt for rattles. These should be located and the parts tightened up. At the same time observe the action of the motor, and if it is running reasonably well let things alone.

Look over the equipment of the car, such as the speedometer, to make sure that the shaft is in good shape. See that the lamps are properly secured to their standards, that the curtains are all in good shape and working order, because later on you may be caught in a storm and need them badly at short notice. Pay particular attention to the tool kit. Make sure that you have not lost part of it, and that the jack and tire pump are in proper working order. Look up your old chains, and if they are badly worn in spots or have broken cross links replace them with new links. Look up your old tires and inner tubes. Perhaps these are in such condition that the casings can be retreaded, bad cuts vulcanized and the punctures in the tubes patched. Have the metal work all gone over, cleaned and polished. Clean your carpets, slip covers, etc. Then put your tools, spare tubes, a few clean rags and any other articles which you may carry into the car.

Remember, your automobile is a piece of machinery and must be cared for as such. The most economical thing you can do is use plenty of lubricant at all times. Except for filling up your crank case, clutch case, transmission case and rear axle too full, there is no such a thing as lubricating an automobile too much.

AUTOMOBILE DEALERS.

There Are Now About 18,000 Men Who Sell Cars in This Country.

In a recent address in Chicago at a banquet of automobile dealers, the president of the Studebaker Corporation said: "While we cannot yet claim that automobiles carry more people than their two chief competitors in self-propelled vehicles, namely, the railroads and trolley cars, the day will come before many years when this will be true. This prediction is made because of the far-reaching and ever-growing popularity of the automobile, its application to individual uses, its wide range of action, its economy, privacy, charm and healthfulness. The automobile is 'par excellence' the vehicle of every man and his family, and for business as well as pleasure. He clings not to beaten paths, but traverses the highways and byways of the country, and goes wherever he chooses. He increases the scope of his world, enlarges his knowledge of men and conditions, and thereby broadens his experience and ability, and becomes a happier and more prosperous citizen. The railroad and trolley lines do not afford man such traveling facilities, chiefly because they follow beaten paths, run on fixed time schedules, and compel men to travel in a body without privacy and often in discomfort, as witness crowded cars, bad air and the unhappy 'strap hanger.' It has been my observation that, given the choice in making a trip, every man will choose an automobile if the weather and roads are fair. When they are against us, I must admit that the railroads and trolley lines afford not only necessary but very comfortable and appealing means of travel. You may, however, see in this comment a hint of the value of good roads for our industry.

"I cannot leave the subject of adaptability of the automobiles to the use of man without specifically mentioning the farmer, who, as we know, as a class, is the largest user of automobiles in this country. The farmer was quick to realize that the automobile increased his efficiency on the farm, afforded means of daily visits to his neighboring cities, and less frequently the means of touring the country and far off places, and, above all, that the automobile forever dispelled the isolation of farm life by reason of its strong appeal to the entire family as pleasurable enjoyment, enabling them to visit their neighbors and relatives whenever so disposed.

"A representative of one of the great London dailies, while in America several years ago investigating the automobile industry, in reply to a question of mine about the demand for automobiles in England, said to me: 'Every man in England who does not own an automobile is hoping and looking forward to the day when he can buy one.' The appeal of the automobile has grasped the mind and imagination of more people than has perhaps any other manufactured article in the history of the world.

"Do you, gentlemen, realize that every man or woman who is able to own an automobile is a possible customer in whom you do not have to create the desire for possession?

"Can you name another manufactured article of which this can be said?

"Reflect upon this fact, ponder it well, and you have the answer to the wonderful growth and development of the automobile industry and its possibilities for you as a merchant.

"The selling policy of automobile manufacturers is to dispose of their products through local dealers instead of selling consumers direct through retail branches and salesmen, as is the policy of manufacturers of typewriters, adding machines and some other devices. The result of this policy has brought into existence in the United States about 18,000 retail automobile merchants whose annual sales, including automobiles, parts and accessories, aggregate roughly one billion dollars, from which they receive a trade discount from the manufacturers averaging 20 per cent., or $200,000,000, which averages a little over $11,000 gross earnings per automobile merchant per annum. You must remember that the sales and gross earnings of automobile merchants in large cities greatly exceed the figures mentioned, and that the average figure given includes many thousand small towns. This vast sum of about $200,000,000 finds its investment and resting place in the local communities of the country, either through the expenditure by the merchants for their ordinary operating expenses or in the shape of permanent investment.

"It is therefore quite apparent that the automo-

Digitized by Google

bile industry is one of vast importance to the mercantile and financial interests of the country. It is an industry that has appealed, and will continue increasingly to appeal, to local merchants of the highest type and ability. Nevertheless, I believe that the business men of this country hardly realize, as yet, the great opportunities of the automobile business for merchants' success and local prominence.

"To illustrate the money-making possibilities of the automobile business, let us compare it with other businesses.

"Take a typical town of 10,000 population. We find in it nearly always one or more retail merchants in the grocery, dry goods, clothing, boot and shoe, drug, hardware and furniture business. Probably one of these retail merchants on the average carries a stock of $10,000 worth of goods, and sells an average of $20,000 worth of goods per annum, upon which he makes a gross profit of, say 25 per cent., or $5,000, leaving his cost of goods sold $15,000. This merchant, therefore, is turning over his inventory investment twice per annum, and making 50 per cent. gross profit thereon, from which, deducting his expense of doing business, exclusive of personal salary, which averages say 15 per cent. on his sales, or $3,000, leaves him a net profit of $2,000.

"These local merchants are the bone and sinew of our towns and cities. Many of them are able merchants and men of fine ability. Yet their profits are not large, as you see, and every year many of them fail in business. I believe and predict that many of these merchants will in the near future realize its possibilities and invest their money in the automobile business and become local automobile merchants. For comparison's sake, assume that one of them did so, what would be the result?

"In the first place, assuming that he represented a manufacturer whose cars averaged $900 list price, and he received 20 per cent. discount, he could carry an ample inventory of five automobiles for $3,600, which, with $400 worth of parts, would make his inventory investment $4,000. He would probably sell in the exclusive territory allotted to him by the manufacturer twenty-five cars per annum at $900 each, making his gross sales $22,500, to which I will add $500 for parts, making his total sales $23,000, from which he would derive a gross profit of 20 per cent., or $4,600, leaving the cost of his sales $18,400, which, against an inventory of $4,000, would mean a turn-over of his inventory investment 4.6 times per annum. His expenses, exclusive of personal salary, would hardly exceed $1,600, and his net profit would be $3,000.

"Thus, instead of an inventory investment of $10,000, he would need only $4,000 capital, and would turn over his investment 4.6 times instead of twice, and would make a net profit of $3,000, or 75 per cent., instead of $2,000, or 20 per cent. per annum.

"This comparison is made to illustrate the possibilities of the automobile business to retail merchants in towns of 10,000. For towns of 20,000 the figures can be doubled, and trebled for towns of 30,000, and so on.

"As a manufacturer I believe retail automobile merchants can prosper best by handling one make of car exclusively, because in that way they concentrate their attention upon one thing only, and can therefore intensify their efforts and obtain better results."

BACK WHEELS.

Why They Should Come Off Hard on Ford Cars and How to Remove Them.

It is only very occasionally that a back wheel has to be removed on a Ford car. Removal is usually needed when it is a question of replacing or adjusting the back brake shoes.

Removal is by no means easy, the back wheels being forced on to the hub. The axle is tapered, and there is a corresponding taper in the wheel, so that as the wheel is driven on to the axle by pressure from a nut, it tends to bind. The wheel is prevented from actually turning by means of a long key extending in a key-way along the back axle, and engaging a corresponding key-way in the hub. It is, of course, the binding of the hub on the taper that makes removal difficult.

A wheel-puller will be required for the work. Such tools are sold by dealers of Ford accessories at a low price. Screw off the brass hub cap with the kit tool provided. There will then be exposed a large hexagonal nut, castellated and split-pinned. Remove the split pin and screw off the castellated nut. Then take your wheel-puller, and after first screwing well towards you the central bolt therein, screw the body of the wheel-puller on to the threaded portion of the hub from which you previously removed the brass hub cap. Having got it on as far as it will go, screw inwards the central bolt of the wheel-puller until you have got it in just as far as possible. By so doing, you may be able to draw the wheel off without further trouble. That, however, is quite unlikely, owing to the jamming action referred to above. Take a good heavy hammer, and give one or two hard, smart blows on the head of the wheel-puller central bolt. Tin-tack blows are quite useless; give really good smacks. That will almost certainly loosen the wheel, and enable you to pull it right off. If it does not, inject kerosene from a spouted oil can round the central spindle of the hub. The kerosene will take some time to creep along the tapered hub, but it will eventually get there.

If you find that the wheel comes off very easily, you will know that it has been wrongly placed in position on a former occasion. The back wheels ought to be jammed very tightly. In replacing this time, take care not to repeat the mistake. Put back the wheel into position, seeing that the key enters the corresponding slot in the hub. Then replace the large hexagonal nut, and screw it up just as tightly as is possible with a sturdy wrench not less than a foot long—the longer the better, within reason. That will jam the hub on the taper tightly. When, however, you come to replace the split pin, you may find it impossible to do so, by reason of the hole being covered, or partly covered, by one of the castellations. Ordinarily, all you could do would be to slacken the nut back slightly until you can insert the split pin; or if the hole were only partially covered you would use a thinner split pin. In this case you must positively do nothing of the kind. Screw the nut off again, and put on the spindle a flat washer of such thickness as you calculate will enable you to tighten the nut up against it, at the same time leaving the split-pin hole uncovered. You may have to experiment with washers of different thicknesses. A tin washer even may be required. In any event, however, you must get the nut screwed up as tight as possible and leave the split-pin hole free. And

Digitized by Google

you must have a split pin of full thickness—one that will only just comfortably go through the hole. If at any time a back wheel gets at all loose on its taper and begins to worry the long key, you may have serious trouble. Therefore, it is absolutely necessary that the nut should be tight up and that it should be prevented from turning, even a thousandth of an inch, after tightening.

If you get the wheel off too easily in the first case, this is an indication that you have been running risks.

Replacing Ford Brake Shoes.

Properly used, a pair of brake shoes will outlast 20,000 miles. Improperly used—for regular braking—they may be worn out within 1,000 miles. Remove back wheels in the manner described in the foregoing pointer. You will now see the brake shoes. Remove the bolt which acts as the main bearing to the shoes. This is a question of taking off the split-pinned nut behind the brake drum. When this bolt is out, the old shoe can be withdrawn and a new one inserted. Watch the way in which the various parts engage before removal, and you will have no difficulty in replacement.

You will, of course, have to readjust the clevises on the hub-brake connecting rods, which have presumably been screwed up quite a long way to take up the wear on the old shoes. The best time to adjust is when both wheels are off and the new shoes are thus exposed to view. The adjustment ought to be such that when the hand-brake lever is vertical, the brakes are just coming on to the drums. It is important that both should meet the drums simultaneously.

If the internal brake mechanism is not lubricated by overflow from the differential, give a good dose of grease at all friction points, particularly in the brake cams—the butterfly arrangements that separate the two halves of the brake shoe when the hand-brake lever is pulled.

Behind the cam wear is apt to occur, and a thin washer may with advantage be inserted if the wear has been considerable. If the wear has only been slight, it may be taken up by winding round and round its spindle, inside the brake drum, a length of fine steel wire of the kind that can be bought in coils at hardware stores (often used as a substitute for gut in fishing lines). This tip by the way is also applicable to other parts in the car where slight wear has occurred, and where the result of looseness sets up a rattle. If a washer has to be inserted, it will be necessary to drive out the pin which attaches the hub-brake cam lever to the cam itself, and that is hardly a job for an amateur. It is quite possible to drive out this pin with a punch, and thus free the levers, so that the cam can be removed, and a washer inserted behind it; but it is not so easy to ensure the pin being properly replaced afterwards. It must fit tightly in position and be burred over at the end by pounding with a hammer. This work, however, is better entrusted to a motor mechanic, for it is not wise to take the risk of this pin getting loose on the road, the back brakes being vital to your safety.

Broken piston rings will make themselves known by decreased compression, and by an excessive amount of oil in the combustion chamber and on the spark plugs.

Useful to Car Owners.

From Lawrence W. White, Massachusetts.—I drive one of the earlier model Lancia cars which has for sole source of ignition a Bosch magneto. Except in cold winter weather starting the engine is a very quick and easy matter, and I have never known a back kick with the spark properly set. In cold weather I am obliged to remove the four spark plugs and inject gasoline into the cylinders in order to loosen up the congealed oil on the cylinder walls so that I can spin the engine. It is an L head motor so that priming plugs are of no use. The motor starts thus on the second revolution even in cold weather. Does the raw gasoline in the cylinders create an undue amount of carbon, and am I thereby choking up the cylinders with considerable carbon? Upon starting there is only a puff of smoke from the exhaust, and it would appear that the priming charge burns up cleanly. I have tried a great many kinds of carbon removers in the past, and do not hesitate to say that the only satisfactory way of getting rid of carbon is to have the engine burned out with oxygen. It is my opinion, based on observation, that at least eight out of ten drivers keep the spark too far advanced in driving, and I believe this accounts to a great extent for the pounding loose of the main and connecting rod bearings. Every manual and instruction book tells you to keep the spark as far advanced as possible without causing a knock. Therefore, most drivers keep it at full advance, or nearly so, under all conditions. The strain on the crankshaft and engine bearings is tremendous when the car picks up from a slowdown, or on a hill. By actual tests I have learned where to carry my spark under all conditions and am getting more out of my car than I ever supposed it was capable of. If the engine in my car was handled the way different friends of mine and garagemen advise, it would be junk in short order.

Women Make Good Chauffeurs.

"Women not only make good auto drivers, but the proportion of women who attain proficiency in handling cars under adverse conditions is probably larger than with the men. This was the declaration of H. C. Brokaw, principal of the automobile school of West Side Y. M. C. A., New York, when his attention was called to a statement by a Brooklyn coroner and later comments in the daily papers:

"The coroner may be right in his remarks," said Mr. Brokaw, "for doubtless the type of women who come before him in his official capacity are temperamentally unfitted to run an auto. But so are the men of the type he deals with. There is unquestionably a type of persons who are wholly unfitted to drive a car in a ten acre lot all alone, but the type is not limited to the women and my experience is that the male of the species is more deadly in the case of the auto.

"In our school we often have to tell men that they never will learn to operate a car. They are either too nervous and act spasmodically, or so slow that they do not move in time, or so stupid that they never get the levers straightened out in their minds and so cannot stand the strain of our congested traffic.

"We find in the school that women know they are supposed to be shy on mechanical capacity. It

Digitized by Google

makes them cautious and supplies any defficiency. We take them into crowded streets, put them in all sorts of emergencies requiring quick action and quicker thought and decision, and they meet the emergency. The men are apt to 'take a chance,' the women never. Then they are only able to run the car, but to keep it in order and if it goes wrong to fix it in a jiffy. They know what they are dealing with, how it is made and works and what they can do with it. Scores of women are operating cars successfully and those who hold contrary opinions would better revise them."

New York Licenses.

There has been an impression in many parts of New York State among owners that a half rate for registration of cars that have been registered for the four preceding years is to prevail. The law was repealed last April.

Among other matters set forth in the letter sent to automobilists are the following revisions:

"The owner of a car who disposes of same to another is required to file immediately with the Secretary of State a notice of sale giving date, register number, name of purchaser and address.

"The purchaser of a car which has been previously licensed under an owner's registration, is required to file within ten days of date of purchase, with the Secretary of State, a vendee's affidavit on a form furnished by the latter. A fee of $1.00 is payable at the time of filing.

"Cars bearing dealers' plates are to be used for demonstration purposes only, and dealers are warned against the use of plates except as prescribed by law.

"The car itself is registered and plates issued at the time of such registration are intended for that particular car. Therefore, plates cannot be changed from one car to another.

"Any person operating a motor vehicle as an employe or any person operating such a vehicle for hire is required to take out a chauffeur's license."

Cure for a Reversed Battery Cell.

It sometimes happens that one particular cell in a battery will be the cause of much trouble and annoyance to the user, the specific gravity of the electrolyte falling during charge and recovering again during the discharge of the cell.

This action is, of course, the exact opposite to that which takes place in a normal cell, and it is fairly safe to predict that a reversal of polarity has taken place. Before attempting a cure, one should carefully examine the cell to ensure that it is correctly connected to the other cells in the battery. The positive of one cell should be connected to the negative of the next, and so on throughout the series. If the distinguishing positive and negative marks have been obliterated or omitted from the cell, the plates should be counted, and since there is always one more negative than positive the polarity may be readily determined. If the cell be found then to be wrongly connected the mystery is explained, but if the connections be in order we must look elsewhere for the cause of the trouble.

Through some loose paste lodging between the plates, or some outside substance causing a short circuit, the cell may have been run down. If this action occurred during charge the cell would be practically cut out and the density of the electrolyte would remain at the discharge valve. Now it is quite possible that the shorting substance may be removed during the battery discharge, and the current flowing through the discharged cell will then result in a change in its polarity.

To effect a cure the cell should be removed from the battery and thoroughly cleaned, all loose paste and sediment being removed and the separators between the plates attended to. The cell should then be charged in the correct direction, preferably at a slow rate, and gradually brought back again to its normal condition.

In this connection it might be well to recall that the density of the electrolyte increases during ordinary charging, water, owing to the chemical changes that take place, being replaced by sulphuric acid of higher density. On discharge the density falls, acid being replaced by water. The polarity of a cell is determined by the direction of the charging current, and it will be clear then that a discharged cell will have its polarity reversed by a general discharge current from the battery. The density of the electrolyte in the defective cell would then increase during discharge, the density of the remaining cells falling at the same time.

Some manufacturers send their batteries to purchasers with a large amount of lead sulphate present upon the plates, or, in other words, in a discharged condition. It is then very important to charge the cells fully when they are received and to maintain the charge during the interval of time specified by the makers. It is quite possible that a reversal might be caused owing to lack of this precaution.

Removal of Ford Valves.

First get a valve lifter to remove the valves, it is necessary to take off the cylinder head and also the valve covers. You can remove the valve covers without taking off the inlet and exhaust manifolds, but the subsequent work becomes much easier if you take off these manifolds. The removal of the valve covers is simply a matter of taking off the nut at the center of each, and then prising the cover away; but be careful not to injure the oblong felt gasket (which is under each cover) in so doing. The removal of the manifolds is simply a question of removing the clamps that hold them to the cylinder. These manifolds are numbered 3060 and 3062 in the Parts List. The best time to remove the valves is when you have the cylinder head off for decarbonization.

To use the valve lifter, compress the spring (with the spring seating) upwards by the method applicable to the particular tool you have, thrust down the valve head from above, and you will then be able to withdraw the pin, or cotter, that goes through the valve stem. The valve can then be withdrawn upwards. You will then be able to inspect the valve thoroughly.

In replacing the valve, you may have difficulty in reassembling the parts, viz., valve, spring, spring seating and cotter. First put spring and spring seating together; put into position under cylinder casting, and press up with the valve lifter. Then push valve through from above, noting position of cotter hole in stem before doing so. The valve should preferably be dropped in so that this cotter hole runs diagonally from front to back. If you do not note

Digitized by Google

position of hole before dropping valve in, you may hunt for it for quite a time in your effort to insert the cotter. See that the cotter is central—not sticking out more at one end than the other. Lower spring and spring seating on to the cotter, and check cotter again for centrality. (If not central, it may work out.) If cotter is worn or bent, replace with a new one.

ELECTRIC CARS.

Prospect of a Great Increase in Their Use and Usefulness.

From A. J. Marshall, Secretary Electric Vehicle Association of America.—The past year has seen many changes and improvements in the electric vehicle industry, all of which point to an unusually bright future both for the electric in the commercial field and as a passenger car. There have been no sudden, illusory spurts of popularity in the progress of the electric vehicle, rather, it has been a gradual, steady growth, forming a good strong foundation upon which to build up its ever-increasing business.

Ever since the transportation world has recognized the value of the motor truck as a medium for transporting merchandise, it has invariably been admitted in the larger cities, where there are opportunities of testing the various forms of trucks, that while the gasoline motor truck is especially adapted for long, uninterrupted hauls, the electric vehicle is the desirable and economical vehicle for city and suburban work.

The Boston Institute of Technology, employing the best authorities in an unbiased study of transportation problems, bears out this statement of the electric's adaptability to city traffic after four years of observation and statistical study. Indeed, all we need do is to observe the large fleets of electrics in our city streets which have been adopted by our largest and most conservative business houses.

While nearly all of the largest fleets of electric vehicles have been installed primarily through the efforts of the vehicle manufacturers, the electricity supply companies (central stations) of the country have exercised considerable influence in the promotion of the electric vehicle. However, there are comparatively few that appreciate the tremendous opportunities attending its further development.

In New York City, for example, there is a minimum of something over $10,000,000 annually to be derived from the sale of current for electric vehicles in place of horses. Of 10,000,000 horses that are in use in the cities and towns of this country probably all could be successfully displaced by electric vehicles. This would mean an additional income to some 6,000 electricity supply companies of about $1,000,000,000. This is all the more significant when we consider that the combined income of all these central stations from all sources last year was approximately $450,000,000, of which but a very small percentage was derived from the sale of current for electric vehicle charging. Even if only a small fraction of the business in sight were obtained, it would represent a tremendous increase in the total incomes to the electricity supply companies.

That the horse and wagon is gradually being displaced by the light electric delivery wagon has been demonstrated by the very successful campaign recently carried on by a well-known manufacturer of vehicles of that type. Within its capacity rating the small 750-pound electric delivery wagon costs less to operate than a single horse wagon, and can perform a far greater amount of work. Where conditions are such as to demand mileage ranges of thirty, forty, or fifty miles per day, the saving obtained by the use of this car may actually cover its cost in less than two years, and this after all other running expenses have been paid. It costs less to keep this car in tires than it does to keep a single horse in shoes for the same work done.

Another important development of the electric vehicle during the past year in a special field is its adoption for municipal service by many of our most progressive cities in one form or another. It is with considerable interest that fire chiefs throughout the country are watching the results and performance of electrically propelled fire trucks and engines in the cities where they have been adopted. This should prove an especially fertile field for the exploitation of the electric because of its inherent qualities of absolute dependability, its ease of operation, immediate response to driver's touch, and great simplicity of working parts, all of which are vastly important in operating fire apparatus.

The very latest development and one which will play an important part in further popularizing the passenger electric is the electrically driven taxicab. The present gasoline taxicab service in many of our larger cities and especially in New York, is inefficient, in many instances unsafe and costly to operate. An electric taxicab has been developed by a company in Detroit, where there is now a fleet of forty-seven in operation, which has all the exclusive refinement of a privately owned limousine in appearance and is operated with far greater ease and safety than the very best of the gasoline taxicabs. Plans are now under way whereby a company will be formed to introduce electric taxicab service in New York and other large cities in this country.

The battery rental plan for commercial vehicles, which has been in existence for a number of years in Hartford, Conn., is just beginning to force recognition in other cities and will, without doubt, become extensively employed throughout the country during the coming year. The aim of the Battery Rental System is to widen the scope of the electric truck, increase its mileage, and reduce the initial cost. The truck user buys a truck with chassis and body adapted to his particular requirements without the battery. The electricity supply companies or charging stations of the various cities where this system is used keep him supplied with charged batteries to run his truck. In other words, he buys from the electricity supply company, not energy at so much per kilowatt hour, but transportation service. He pays a flat charge for garaging and battery maintenance depending on the size of his truck.

In addition he pays so much per mile for the total mileage traveled as indicated by the odometer on the truck. When one set of batteries are nearly exhausted he receives a freshly charged set from the nearest charging station, taking from two to four minutes for the exchange, less time than it takes to refill a gasoline tank. This system is already in practical use in Hartford, Conn.; Boston, Worcester, Baltimore, Salt Lake City, Fall River, Spokane and San Francisco.

The Battery Rental and Exchange System is also

Digitized by Google

being developed successfully for the passenger car type. Coupled with this project will be a very substantial reduction in the price of electric vehicles. Already one large manufacturer of passenger electrics in Chicago is selling a vehicle minus batteries for nearly $1,000 less than last year, the purchaser renting the batteries from the various service stations throughout the city.

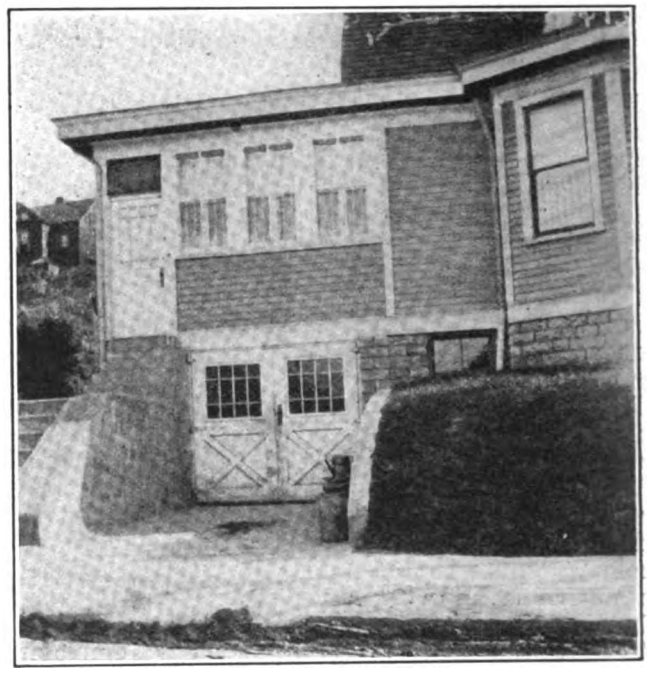
Other phenomenal price reductions in electric passenger vehicles have been due to quantity production and an unprecedented increase in sales. A decrease of $875 was announced by one company which has been carrying on an extensive sales campaign, and other manufacturers have offered reductions of from $300 to $800. All of this augurs well for future popularity of the electric, and already its recognition as the most satisfactory car for city and suburban use is evidenced in the greatly increased numbers which we see daily in the streets.

The past year has been marked by a number of successful long runs organized by several of the leading manufacturers. Fifteen hundred miles in fourteen days, using but a single charge of the batteries per day, was the record made at Los Angeles, Cal. Recently an electric made a run of 180 miles in less than ten hours, and the same make of car also accomplished a 375-mile run from Hartford to Washington in an actual running time of 121 hours. The trip cost $5.65, or less than 1½ cents per mile. One hundred and forty and even 160 miles on a single charge of the batteries has been made.

BUILDING A GARAGE.

The Size, Construction and Quality Depend Upon the Means and the Ends.

The building of a garage is a subject of such wide ramifications that it can be scarcely more than touched in a single article, quite a large volume being required to cover the matter fully. The question of material depends largely upon the locality as well as upon personal choice and cost. Then the size and equipment may be as varying as the size and equipment of dwellings or any other structures.



The writer recommends a perfectly level floor without any fall for drainage, otherwise considerable effort will be required on the part of one person to move a heavy car. The floor of a garage should be washed in the same way as a tiled lobby, consequently a sloping floor is not required. It is, of course, necessary that some fall should be given from the four sides of the washing space towards the drain in the center, but there need be no difference in level between the sides of the washing space and the floor.

As regards material for the floor, the writer does not favor the use of cement, for oil disintegrates a cement floor, and steel-studded tires are liable to cause the surface to flake off. Good, smooth-faced stone flags or bricks are to be recommended in preference—they are much more serviceable and are non-slipping. For the wash-floor a concrete finish is recommended with a "floating" of cement, sand, and granite chippings, although small hard tiles having a sunk chequered pattern, so as to be non-slipping, and laid on a bed of concrete, are equally suitable.

The Pit.

The question of whether or not to make a pit is one that immediately crops up when considering the building of a garage, and, although it must be at once admitted that the upkeep of a modern car does not often call for the use of a pit, there are occasions when it is necessary and urgently wanted, so that unless the cost of the building be a matter for very careful consideration a pit is recommended.

In most cases it will be advisable to drain the pit, but where this is impossible by reason of the level of the main drainage being above the floor of the

Inexpensive and Right at Hand.

pit a water-tight construction must be made, otherwise water will percolate through the bottom and sides and lodge within the pit. But whether a water-tight construction under such circumstances be made or not, a good plan is to have a small pump at one end similar to the gravy well of a meat dish, in order that water finding ingress from any source may be easily scooped up.

It is much better to have the pit at right angles to the position in which the car usually stands, rather than longitudinally, but, of course, the house must be of sufficient dimensions to allow the car to be pushed fore and aft to enable all under parts to be examined from the pit. Whether the pit be placed at right angles or otherwise to the car it is very important that it should be long enough for any person standing beneath the car to enter or leave easily.

As regards means of descending into the pit, the best method consists of a flight of steps covered over when not in use. A small garage space will not, of course, allow of this method being adopted, and a short ladder is then the best makeshift; manhole step irons are to be avoided, a spot of grease on any one of them being likely to cause a slip, and possibly a more or less serious accident. Further than this, when one is climbing out of a pit by means of manhole step-irons, there are no irons for the hands to clutch to prevent one falling backwards when more than half-way up—all one can do is to claw at the floor. In addition, one cannot get in or out of a pit with tools or parts in one or both hands when step-irons are used—the hands must be free to hold on by.

Many designers of car houses do not allow suffi-

Digitized by Google

cient space all round the car. It is not enough simply to allow room for one person to pass around at a time, but three or four feet at least should be allowed to enable adjustments to be made without the operator being cramped. This extra room is especially convenient when there arises necessity for tires or spare wheels to be manipulated, and the three or four feet to spare should be in addition to any floor area taken up by benches or tool chests.

As regards lighting, it is very inadvisable, in the writer's opinion, to admit a south light, otherwise the house will be uncomfortably hot in summer. At the same time there are many owners who prefer to take advantage of the spring, autumn and winter sunlight in helping to keep the interior of the building free from damp, and to fix suitable blinds or shutters to exclude the summer heat and light. The writer invariably recommends that every car house shall have some provision for top light, for this adds considerably to the facility with which work may be done, especially on dull days. The ceiling light should be made to open so that it can be cleaned.

Artificial light would, of course, depend upon the facilities available. Electric light is undoubtedly desirable, but if care be taken to prevent any fumes from the gasoline escaping and the tank be not filled in artificial light there is no actual danger from the use of gas. Remember on all occasions that the fumes from gasoline descend, and consequently it is far more dangerous to work with a naked light in the pit than it is to have a gas jet burning above the car.

Convenient But a Bit Obtrusive.

Many car houses are spoiled by having an entrance door which is too small and necessitates careful driving to enter or leave without touching some part of the car on one of the door-posts. In no case should the doorway be less than 8 feet wide. If the run-in or entrance be oblique, extra width of doorway should be provided.

Where hot water radiators are used to heat the garage care must be taken that they are not placed in such a position that any direct heat will impinge upon the tires, wheels, or bodywork; they must be kept well clear from the car, otherwise perished tires, loose wood wheels, and cracked varnish will ensue.

As regards the exterior or architectural treatment, this will naturally depend upon the materials available, and in many cases a design and construction in keeping with those of the owner's residence will be preferable.

Where a roof ventilator is especially provided the upper portion of one or more of the side windows should be fitted with casements to admit fresh air, otherwise the circulation of the air will be prevented and the roof ventilator will not serve its purpose.

The Boston Show.

When the public are afforded a chance to peer into Mechanics Building, the home of the Boston Automobile Show, which opens March 4, there will be a greater number of motor cars and commercial motor vehicles on display than any other show in the United States or that any other country can boast of. One month before the date of opening the official list shows many cars in excess of those displayed in either New York or Chicago, with more than a score of pleasure car dealers and manufacturers clamoring for a chance to display their goods.

Manager Chester I. Campbell is at work endeavoring to rearrange the space in the balconies so as to make room for more cars. The accessory space has been sacrificed to make room for automobile displays. At least ten different displays will be located in the balconies. Although considerable flooring has been taken from the accessory department, yet over 175 individual exhibits will be made in that section of the show. Scores of applications for space in the accessory department have been passed up because of lack of room.

The official list at this time shows 107 different makes of pleasure cars and commercial vehicles. Seventy-four of this number will be displays of pleasure cars. There will be 33 different makes of trucks exhibited. In all probability there will be at least ten more added to the pleasure car list before the show opens.

Despite the crowded condition there will be six cars that will make their debut to the New England trade at the forthcoming Boston show. The debutantes will be the Owen Magnetic, Hollier, Bell, S. J. R., Fostoria and Daniels. There will be several new trucks exhibited.

Perfection Grease Retainers.

In our November number we printed a little item from one of our subscribers, H. F. Fracker, relative to Perfection Grease Retainers for Ford cars. This item has brought us a lot of letter inquiries for the name of the manufacturer. Several of our subscribers have now furnished us with this name and we understand that these devices are manufactured by A. P. Worthington, 1220 San Pedro Street, Los Angeles, California. One subscriber says "I procured a pair, had them applied and they have worked perfectly. I believe that before they were put on I had the nastiest looking Ford car in existence. The rear axle apparently was not intended to hold grease at all."

THE MORE THEY WARN.

The More the Doctors Are Seen Using Speedy Automobiles.

Dr. D. Bryson Delevan of New York City recently discussed in a paper read by him before the American Laryngological Association the effect of motoring on the upper air passages. He referred to the unpleasant odors of the vapors and their harsh and irritating effect on the mucous membranes of nose and throat. The air currents and the dust have a still more marked influence. The particles of dust are now kept out of the eyes pretty effectively by goggles, which are often surrounded by felt or wool to prevent the small grains from working in under the rims. The face is often protected by guards. But so far no respirator has been invented to make the motorist thoroughly happy.

If the fumes of gasoline are to be seriously considered as a factor in modern automobile ills, one must go for his morning spin with all protection against evil gases just as if he were in the trenches of Europe. No one doubts that there come periods of dryness to the throat from prolonged rides in automobiles, but happily there are dispensaries along the main traveled ways where throat treatment amid congenial surroundings may be readily obtained.

Specialists have also pointed out that rapid riding in an automobile produces tinnitus, a certain ringing or jingling in the ears. It is a matter of official record that when one has recently acquired an especially high powered car he is afflicted with a peculiar deafness and cannot hear even loud voices of warning and the shrilling of official whistles. Often these sufferers have to be overtaken in motorcycles before their sense of hearing returns.

That high speed in automobiles often produces a nerve strain has been noted by neurologists, and papers have been read upon this subject before their learned societies. The neurasthenic conditions are often generally associated with the stress and storm of modern civilization. In certain nervous affections, however, there is that unconscious wish to be constantly in rapid motion, which is observed in speed maniacs.

When the motor car was younger and mankind was less accustomed to handling it, many neurologists referred to the tensity of nerves and of a featured expression commonly called "automobile face." This is due to the constant effort and the concentration of the will to the task of mastering unaccustomed tasks. The tightly drawn muscles, the protruding eyes, the open mouth, are aspects of the automobile face which are unpleasant and indicate a tremendous strain. Where the automobilist is more or less oblivious to his surroundings and is occupied with the intricacies of his car, the workings of his countenance are unpleasant to witness.

In the early years of motoring, physicians were much concerned about inflammation of the nasal passages and the frontal sinus, but lately there has not been so much trouble along those lines on account of the introduction of the windshield. These ailments were caused by the lodging of germs in throat or nose, hurled by the force of the wind.

The most recent ailment is described as chauffeurs' knee, the symptoms of which were set forth last month in The New York Medical Journal by Dr. Gustav F. Boehme, a neurologist connected with the West Side German Dispensary. Chauffeurs' knees, as he remarks, is not unlike tango foot, which is now rapidly disappearing, and was first described by him. It more closely resembles that prosaic ailment, housemaids' knee. Dr. Boehme says that within the last few months many chauffeurs have come to the dispensary and complained of pains in the knee caused by the operation of the pedals. Often the trouble does not appear when the motorist is following his usual gait, but manifests itself when he climbs stairs. He has prescribed for this complaint a cessation from driving and the application of a solution of sub-acetate of lead and opium. To prevent permanent stiffness of the knee he suggests the knee gets passive massage or the baking of the affected member.

The consensus of the medical profession seems to be that despite the ills which are from time to time catalogued as coming from the modern automobile it is in reality a boon to mankind. Suitable clothing, the protection of eyes, ears, and nose, and the development of the motor car's mechanism to such an extent that the strain on rider and driver is constantly reduced have all contributed to enhancing the benefits of automobile riding as an exercise.

Dr. Delevan and others have written about the merits of the limousine, which can be properly heated and so ventilated that for persons who cannot stand the direct exposure to the open air many of its benefits can be obtained.

Dr. P. G. Heinemann of the University of Georgia, in The Popular Science Monthly, gives an appreciation of the automobile viewed from the standpoint of the public health. He declares that if it had done nothing else, it had improved the sanitary condition of city streets and country roads, and that its continued use in years to come will greatly cut down the amount of disease of germ origin.

It is significant that the more that physicians and surgeons write about the maladies and the breakages ascribed to the swiftly speeding car, the more they themselves fly into the face of the danger. The automobile brings to them, as to all, the thrill of rhythmic motion and the joy of the open road.

BRICK ROADS GROW IN FAVOR.

The First Cost is High but They are Durable and Easy to Maintain.

A rapid increase in the mileage of vitrified brick roads in this country is predicted in a new bulletin of the U. S. Department of Agriculture. Such roads, it is said, possess three distinct advantages. First, they are durable under all traffic conditions; second, they afford easy traction and moderately good foothold for horses; and third, they are easy to maintain and keep clean. On the other hand, they are unquestionably expensive to construct and the effort to reduce the high first cost frequently results in inferior construction and consequent defects.

The cost of a brick pavement depends so much upon so many variable factors such as the locality, freight rates, and the distance from brick kilns that it is not possible to make any definite estimates. The cost of the rough grading, however, should be considered entirely apart from the cost of the pavement, for the grading would have to be done no matter what kind of a road was to be built. Ex-

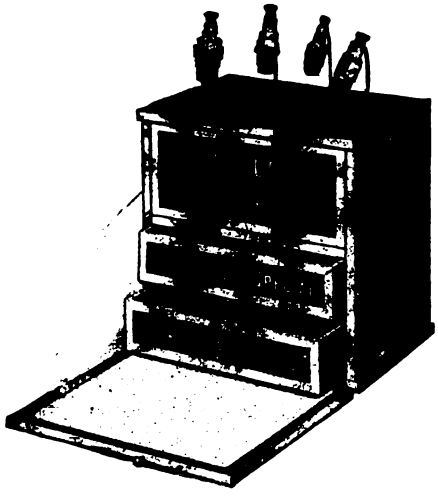
Digitized by Google

cluding this item, the bulletin already mentioned (No. 246) furnishes the following formula as a rough guide for the probable expense of a brick road with a 6-inch concrete foundation and suitable grades: Cost per square yard = 1.90 L + .213 C + .138 S + .157 A + .040 B.

In this formula C equals cost of cement per barrel, S equals cost of sand per cubic yard, A equals cost of coarse aggregate per cubic yard, B equals cost of paving bricks per 1,000, and L equals cost of labor per hour. Thus, if labor costs 25 cents an hour, the labor cost per square yard of pavement will be 1.93 times 25 cents, or 48.25 cents. The cost of the cement per square yard will be .213 times and the price of a barrel and so on with the other items. It is assumed in this formula that all materials are delivered on the work. About 10 per cent. should be allowed for wear on tools and machinery, and for every inch subtracted or added to the thickness of the foundation there will be a corresponding difference of 8 to 12 cents per square yard.

Paving bricks should be uniform in size, reasonably perfect in shape, tough in order to resist crushing, hard in order to resist abrasion, and uniformly graded in order that the pavement may wear evenly. With good paving brick the crushing strength varies from 10,000 pounds to 20,000 pounds per square inch when the load is applied uniformly over the entire top surface of the test specimen. In use, however, paving brick is seldom called upon to withstand a pressure of over 2,000 pounds to the square inch so that this factor is not one of great importance.

A more important test is known as the rattler or abrasion test. In this the bricks are subjected to destructive influences similar to those encountered in actual service, and the effects resemble those which traffic may be expected to produce upon the completed pavement. Briefly the test consists of inclosing 10 dried bricks in a steel barrel in which there are also placed a number of cast-iron spheres. Ten of these spheres weigh each 7½ pounds. Enough smaller ones weighing a little less than a pound are added to make the total weight approximately 300 pounds. The barrel is then revolved at the rate of 30 revolutions a minute for an hour. At the end of that time the bricks are taken out and weighed, and their loss in weight ascertained. In this test good paving bricks will lose from 18 to 24 per cent. of its weight. In drawing up specifications for the brick to be used on any road, it is, however, desirable to specify the minimum as well as the maximum loss of weight which a sample may sustain in order to prevent too great a difference between the softest brick that is acceptable and the hardest that may be supplied.



Equally important with the character of the brick is the character of the roadbed on which it is to

NEW AND INTERESTING THINGS IN MOTORDOM

The Mosler Display Cabinet.

This is an attractive display cabinet for Mosler Spark Plugs, which is very attractive when placed on the counter of any dealer. It is neat, complete and compact and it has receptacles for all

the different styles and sizes of Mosler plugs. This display cabinet is given absolutely free of charge to the dealer if he will order an assortment of plugs amounting to $24.60. The cabinet is beautifully finished in mahogany, nickel trimmed, and there is no glass to break. A full supply of these cabinets is now in stock ready for immediate delivery and dealers who are interested are urged to write at once for complete details to A. R. Mosler & Co., New York City.

Care of Tires in Winter.

"The winter season seems to strengthen the properly inflated tire," says an official of The Fisk Rubber Company. "Underinflation is responsible for a large percentage of tire expense. Most motorists think that during the summer months they should ride their tires at low pressure to prevent blow-outs. The decreasing of the pressure does not decrease the heating of the tire, but rather increases it, as the side walls are subjected to a greater bending strain and friction between the layers of fabric generates heat. Due to this excessive flexing the fabric cracks and loosens up to such an extent that the tire becomes weakened. The cracked and chafed fabric ruins the inner tube. During the winter season the motorist does not let the air out of his tires as he does in the summer, but allows his tires to have a greater and more constant air pressure; hence, the percentage of tires consigned to the scrap heap is much less in winter than in summer. It has been definitely determined by test, with a tire at proper pressure, that it is impossible to effect an increase in air pressure because of the heating of the tire when in use, to such an extent that it will injure it in any way. To prevent your tires from fainting, give them the proper amount of air."

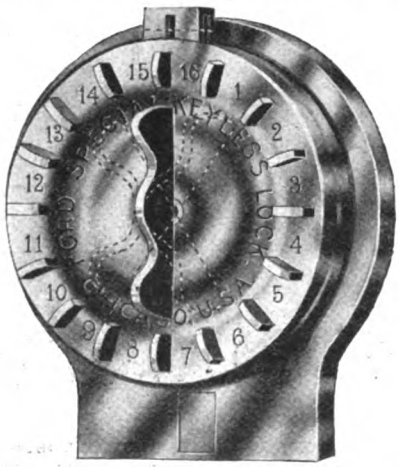
The McCormick Wind Shield Weatherstrip.

This device closes the space on rain-vision windshields, making the shield absolutely watertight, also dust and windproof, and the advantage to the driver is too obvious to need comment. This weatherstrip is adjustable to any space or thickness of glass. It is easily removed and allows free movement of the panes. It is less than a half inch wide and will not obstruct the vision in any way. It sells for only $1.00 and is manufactured by the Robinson Mfg. Co., 508 Lincoln Bldg., Louisville, Ky.

Starting and Lighting for Fords.

The Westinghouse Electric & Mfg. Co., of Pittsburgh, Pa., has made a number of improvements in its lighting and starting system for Ford cars. A new type of cut-out switch has been fitted. The brackets furnished are adjustable, the unit being driven by a Westinghouse compensating sprocket through a special silent chain, which is twice as strong as last year's size. The price remains at $75.

Mattson Rubber Accessories.



This is a very complete line of rubber automobile accessories including the Mattson Slip-On Pedal Pads which are made for all models of Ford and Overland cars and sell at sight. Also high grade tires which are very popular. The Mattson accessories are manufactured by the Mattson Rubber Co., 118 Main St., Lodi, Bergen County, N. J. They distribute their product entirely through the jobbing trade and their price list is sent only to jobbers, but dealers, repairmen, public garage owners or motorists who are interested should write for printed matter and full particulars direct to the manufacturers.

Special Keyless Lock for Fords.

Some time ago, a description was printed in this magazine of the Chicago Keyless Locks which were then being marketed by the Novelty Distributing Agency of Chicago. This concern has been reorganized into a corporation to be known as the Lockwell Company with offices at 20 West Jackson Blvd., Chicago, Ill., and the new organization will control the output of Chicago Keyless Locks in the United States and Canada. A new lock of this description has just been brought out especially for the Ford car, and an idea of its appearance may be gained by the accompanying cut. This lock has 16 buttons in a combination which can be set and changed at will by the owner on any number of buttons from one to 15, thus giving over 20,000 separate and workable combinations. In the special lock for Ford cars, the switch lever or key, is placed in the center of the lock. When turned to the extreme left this lever connects the bat-

New Car Lock.

tery, and to the extreme right, the magneto. When in a perpendicular position, it is in neutral state; the engine stops and the locking process follows. This is done by simply pressing down the lug at the top of the lock which renders impossible the moving of the lever in either direction or of extracting it. Hence the car is locked. There can be no sparking of the engine until the lock is opened and this cannot be done in any other manner except by pressing the correct number of buttons on the face of the lock. It will thus be seen that the owner has an absolute safeguard so that no one can start the car except himself. The device is certainly a clever one and will probably command a ready sale as it sells for a reasonable price and will appeal strongly to many owners of Ford cars.

Wants a Gasoline Inquiry.

A broad investigation to determine primarily whether the segregated Standard Oil Companies are boosting the price of gasoline has been proposed to the House of Representatives in Washington. The resolution calls for a general inquiry into the production, transportation, refining and marketing of gasoline and other petroleum products to lay bare the causes for the recent advances in the prices of these commodities. The resolution calls for the appointment of a select committee to be appointed by the Speaker of the House and to consist of nine members.

Tuthill Springs.

An interesting little booklet telling the story of the discovery of the principle employed in the making of Tuthill Titanic Springs is told in a booklet issued by the Tuthill Spring Company, Chicago. This booklet was distributed for the first time at the New York Automobile Show, and aroused considerable interest on the part of both owners and dealers. The Tuthill Spring is made without center hole or center nib, and it is claimed by the makers that this positively eliminates the possibility of breakage at the center. To anyone interested in the subject of springs, and everyone who owns or sells autos is—this booklet is of highly informative value.

The Tire Business Good.

The increase in the automobile tire business by leaps and bounds in the last two years has caused the Michelin Tire Company of Milltown, N. J., to increase their manufacturing building by an addition measuring 53 by 117 feet. John W. Ferguson Company, of New York and Paterson, N. J., has been awarded the contract. The addition is to be a single story, brick walls, and a sawtooth roof.

Service Standardized Trucks.

Dealers in pleasure vehicles who have not already taken the agency for a line of trucks are neglecting a great opportunity. It has been found in nearly all instances that the live dealer can make a great deal of extra money by taking a truck agency. The Service Standardized Trucks are manufactured by specialists, and truck building is their sole business. The units which are assembled in these trucks are of standard excellency. They include the Buda motor, Timken axles and Timken bearings, Stromberg carburetor, Eisemann magneto, Long's radiator, Brown-Lipe transmission and Ross steering gear. A particularly attractive offer to dealers is made on these trucks, and considerable good territory is still open. Correspondence with dealers is especially invited, and all letters should be addressed to the Service Motor Truck Co., Grand Street, Wabash, Ind.

New Oxy-Acetylene Welding Outfit.

F. W. Stewart, 1509 Michigan avenue, Chicago, is marketing the Russ oxy-acetylene welding plant. The Russ No. 22 welding and carbon burning equipment consists of oxygen and acetylene heads, welding torch with four tips, three aluminum welding rods, steel wire welding rods, six cast iron welding rods, Tobin bronze welding rods, one pound of iron welding flux, and the same amount of aluminum and Tobin bronze flux, one pair of welding goggles and instruction book. This outfit sells at $60.

Storage Battery Charger.

The Lincoln Electric Co., Cleveland, Ohio, is offering a charger for storage batteries, which is made up of two standard electrical machines mounted on the same shaft. One is an alternating current motor, which is driven by the electric current from the regular supply line. The other machine is a generator, which is turned by the motor, thus generating the direct current necessary for storage battery charging. The charger is furnished with all necessary instruments, switches and attachments mounted on a black slate switch-board. The charger is claimed to charge any number of batteries from one up to the capacity of the machine.

New Apco Specialties.

The Auto Parts Company, Providence, R. I., makers of the Apco line of specialties for the Ford car, has brought out a fender brace which occupies the spaces between the fenders and the aprons, completely filling in these places. Not only does the installation prevent movement and rattling of the fenders, but the entrance of mud and other foreign ele-

Apco Fender Brace.

ments. The braces are made up of heavy pressed steel and finished in baked-on black enamel. A set includes four, two for each fender, and screws for attachment. The set retails at 50 cents.

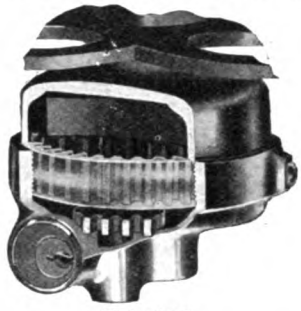
Another Apco specialty is the emergency brake handle. It is easily attached and is positive in its action. It not only adds to the appearance of the brake lever but to its efficiency. Slipping of the lever is positively avoided when the brake is set, as when starting the car on a grade, for example. The new

Apco Emergency Brake Handle.

device retails at 60 cents and comes black enameled. Readers who are interested should send for catalogue, also see attractive two-page advertisement in this issue of the Automobile Dealer and Repairer.

New Heater for Ford Cars.

A new car heater, especially designed for Ford cars, is manufactured by C. E. Bridges, 4537 N. Whipple Street, Chicago, Ill. This device utilizes the wasted heat from the exhaust. It can be attached instantly, and when you have it installed you can ride all day at 10 degrees below zero and your feet will not get cold. If the car has side curtains, the whole interior of the car is kept warm. This heater replaces the regular floor board, and you simply cut the mat away over the heater. This device is inexpensive and it has been adopted this year by a great many owners of Ford cars, and they report that it meets every requirement for heating purposes.



Auxiliary Radius Rod for Fords.

An auxiliary radius rod for Ford cars is manufactured by the Lenolite Mfg. Co., 6 N. Clark Street, Dept. Z, Chicago, Ill. This is an accessory which appeals to every Ford owner immediately, and it is a great seller. The manufacturers state that they expect to sell one million of them this year. Exclusive territory is now open and correspondence is invited.

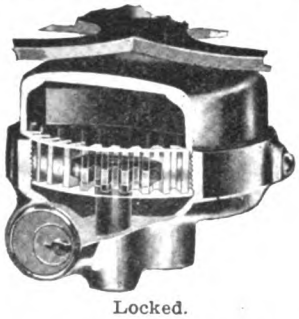
An Effective Car Lock.

The problem of safeguarding a Ford car against theft is at last effectively solved by the use of the Rex Auto Lock, a geared casing, which, when attached to a Ford car, is a positive protection. It takes the place of the regular steering gear cover which is a part of the construction of every Ford car and is attached to the steering gear internal gear



Unlocked.

case just below the steering wheel. The gear case contains an internal gear and a set of differential gears, and when the key is turned the geared sector contained in the lock moves downward between two of the differential gears and intermeshes with the internal gear as shown in the cut marked "locked." This locks the gears so that the wheels cannot be turned and if the car is started it will move at the angle at which the front wheels are set. The lock permits the wheels to be

Installed.

set at any angle desired and it will at once be seen that when the front wheels are set at an angle and locked, the car cannot even be towed. The Rex is an absolute protection against theft and is the cheapest and best form of theft insurance that can be purchased. An insurance policy protects a car only so long as the premium is paid, but with the Rex only one expenditure is necessary. The lock cannot be manipulated and if a thief tried to break same he

Locked.

would only succeed in damaging the steering gear so that the car would be unmanageable. A car equipped with a Rex lock complies with all fire ordinances because when locked it permits the car to be moved but only at the angle at which the front wheels are set. The Rex auto lock is a durable casting highly polished and is equipped with a non-pickable lock. The construction is so simple that it is practically impossible for it to get out of order and it is easy to install, as no drilling is necessary and no unusual tools are required. The price of the Rex Auto Lock is $4 and simple complete directions are packed with each device. Patent pending. Manufactured by De Tamble Manufacturing Company, 1607-1611 Prairie avenue, Chicago.

Hyatt Service Prize Contest.

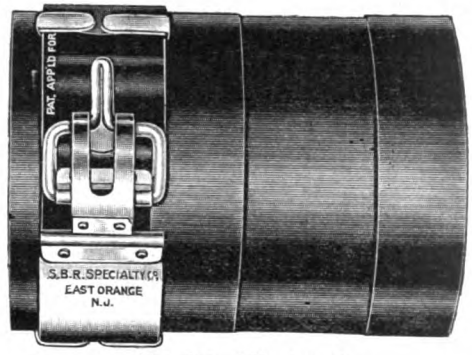
Results of the mileage contest conducted by the Hyatt Roller Bearing Company are of interest not only to manufacturers of automobiles but owners of cars as well. The company's announcement sets forth that the first prize winner, a 1909 Buick, owned by F. E. Slason, of Plainville, Kans., traveled 261,800 miles on its original equipment of Hyatt bearings up to last October, when the car's record was submitted to the judges of the contest.

Seven different makes of cars are represented among the sixteen prize winners, the total distance traveled by the sixteen cars being 2,512,435 miles—equal to more than 100 times around the world. The average distance traveled by the prize winners was 156,814 miles, or more than six times around the world. All of the cars are being operated by their owners to-day, and are piling up mileage records daily on their original equipment of Hyatt bearings. Mr. Slason, who received the first prize of $500, says that more than 300 tires, representing a value of $8,000, have been worn out by the car. All the prize winning records also were made to stand a searching investigation by the company. Other prizes, ranging from $10 to $200, were awarded.

A New Type of Signal.

An entirely new type of warning signal for automobiles has been placed upon the market by the Buell Mfg. Co., 1143 East 46th Street, Chicago, Ill. This is called the Buell Explosion Whistle. It is not an exhaust horn, but is operated directly by the explosion through the priming cup opening in the cylinder, and its extreme simplicity assures freedom from all trouble. It consists of a poppet valve and a 5-oz. whistle. The first cost is low, there is no operating expense and it is very easily installed. It gives a powerful, distinctive note. The manufacturers claim that this signal is far more effective than an exhaust horn, and the gas operating has at least ten times the pressure. This signal is sold on trial and guaranteed for life. A descriptive circular will be sent on request, and good agents are desired throughout the country.

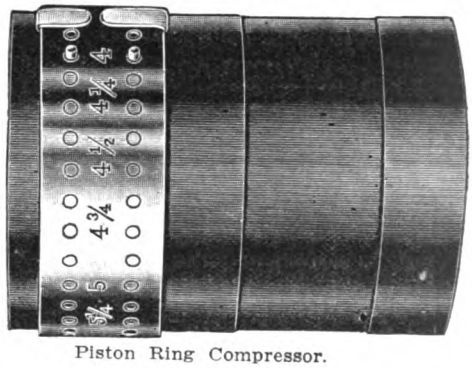
Extending Their Business.



Northwestern Chemical Co., of Marietta, O., took another forward step January 1, when they opened a branch office, display and warerooms at No. 47-49 West Street, New York.

They now have there a complete stock of the various "chemically correct" automobile specialties and will deliver from that point all goods intended for New York, New England, New Jersey, Pennsylvania, Maryland, Delaware, District of Columbia, North Carolina, South Carolina, Georgia, Florida, City of New Orleans, and City of Montreal. All export orders will also be taken care of from the New York branch. The branch is in charge of Mr. G. Sam Scott, who has for a number of years had charge of the Eastern sales of the company. Goods shipped from New York will be invoiced from New York, but will be payable at the home office, in Marietta. By the system of invoicing, the home office can always tell how much stock is on hand in the New York warerooms, and thus keep the supply complete at all times.

The Northwestern Chemical Company make about forty different automobile specialties, the best known of which is Se-Ment-Ol, the radiator cement so extensively advertised as the cement that "finds the leak and fixes it." The company has been very successful, having risen in six years from almost nothing to a position of prominence in the trade, both national and international. And from the outset the affairs of this growing concern have been in charge of that rising young business man, Mr. F. R. Hall, who has been general manager of the company from the time, six years ago, when their factory was an abandoned dwelling house and their mechanical equipment consisted of a tub and a paddle.



Empire Piston Ring Compressor.

With this appliance, which is illustrated herewith, it is possible to evenly contract the rings on a piston so that the same will easily slide into the cylinder.

Showing Adjustment.

It can be adjusted to take all sizes of pistons from 3½ to 6 inches in diameter and it is a very handy article for every mechanic's outfit, being especially useful to garages and repair shops. The device is made of spring brass, nicely nickeled,

Piston Ring Compressor.

and it retails for only $1.50. This article is manufactured by the S. B. R. Specialty Co., 17-19 Princeton street, East Orange, New Jersey.

Announcement to DEALERS

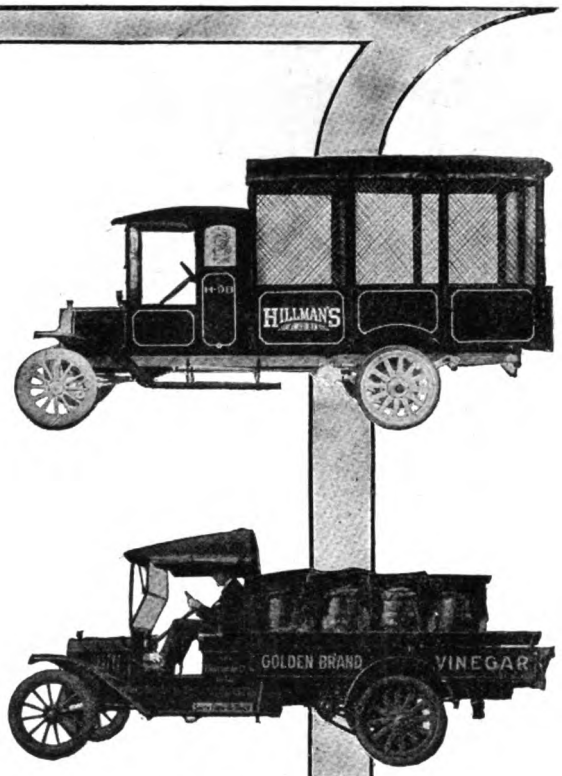
A few of the many Form-a-Trucks now in actual use.

WHAT IS UNQUESTIONABLY THE biggest money making opportunity ever offered dealers is now within your easy reach and, if you act quickly, you can secure an exclusive contract for your territory with full protection.

THE SMITH FORM-A-TRUCK IS NOT AN experiment nor a makeshift. It is a time tried and proven proposition. Over $3,000,000 worth have already been sold. The truck is in daily use everywhere, and is selling like wildfire.

THINK OF THE MONEY YOU CAN MAKE as exclusive dealer for this sensational new invention. Just figure the big number of Ford owners in your territory—then think of the vast number of users for this attachment.

The *Smith Form-a-Truck* will convert an old or new Ford into the most economical and durable one-ton truck that can be made—and at half the price of any other one-ton truck. Highest quality materials used throughout. Think of it—real truck wheels, solid rear tires, chain drive, 125-inch wheelbase, 9-foot roomy body accommodation, special steel axle and springs, Timken roller bearings—and the wonderful Ford axle becomes the jack shaft without a single change—all for $350.



THERE IS NOTHING COMPLICATED about the attachment—it comes complete—no other parts required—and the selling price is only $350. It slips on to any Ford—new or old alike—without any bother or trouble. No skilled workmanship required—two men in a few hours can complete the job.

YOU MAKE BIG MONEY ON EACH attachment sold, more money on the sale of the wheels, tires and body equipment taken off the old car, an additional profit on the new truck body you sell and then you sell a new Ford—and you haven't any bothersome, money-losing trade-ins to contend with—can't beat that, can you?

Digitized by Google

A Ford and $350 GIVES YOU A GUARANTEED ONE-TON TRUCK HAULS 1½ TONS

ONLY THE VERY BEST materials are used in the Smith Form-a-Truck, guaranteed One-Ton Truck. It is honestly built throughout and is so designed that 90% of the load comes on the rear axle. 10 to 15 miles per hour, under full load, easily attained at the lowest possible cost of upkeep and fuel. You drive it just like a Ford pleasure car—no change in the gear shift. The wonderful Ford engine and mechanism remains unchanged.

THIS COMPANY WILL BACK ITS DEALERS to the limit—big direct mailings to consumers—big advertising campaign in national magazines, newspapers and trade papers—and co-operative helps galore. All inquiries for your territory will be referred to you as exclusive agent. No matter how sold, you get your commission if sold in your territory.

WE HAVE MATERIAL FOR AND ARE building 50,000 jobs this year. Within two months our big, new modern acre-and-a-half factory will be completed—everything under one roof. Immediate deliveries are assured. Promptest service guaranteed.

DON'T DELAY ANOTHER DAY—NOT another minute—while you are hesitating some one else may apply for your territory. Wire, phone or write today. Use the coupon—simply sign and send by return mail—this does not obligate you—but you will get our Dealer's Plan in detail.

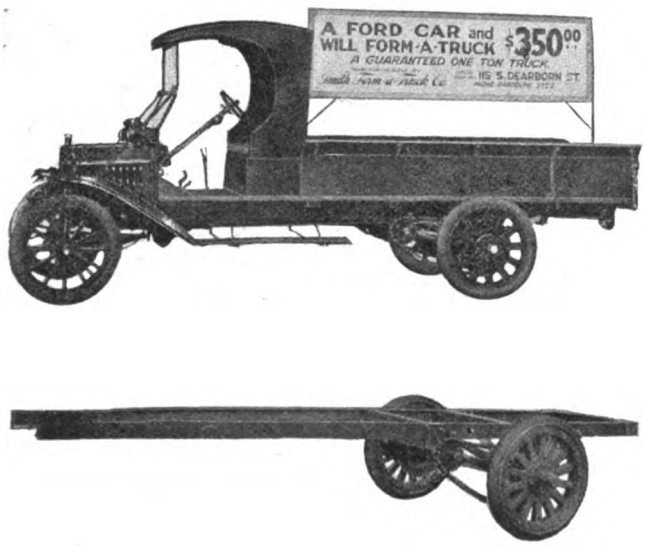
The Smith Form-a-Truck.

Until the day the Chicago national automobile show opened little was known of the Smith Form-a-Truck Company of Chicago, although the company had been in operation six months and was feverishly pushing its production. Two days after the show opened, dealers all over the United States were interested and sending in orders for the attachment, which, for $350, makes a guaranteed truck with a capacity of from one to one and a half tons, of a Ford car.

Despite the fact that no attempt had been made by the company to get national distribution prior to the Chicago show, the potential efficiency of the attachment had secured for the company quantity sales. There are now being sold 50 of these attachments each day. Plans have been made to increase this production to 300 attachments a day, which is equivalent to 70,000 a year.

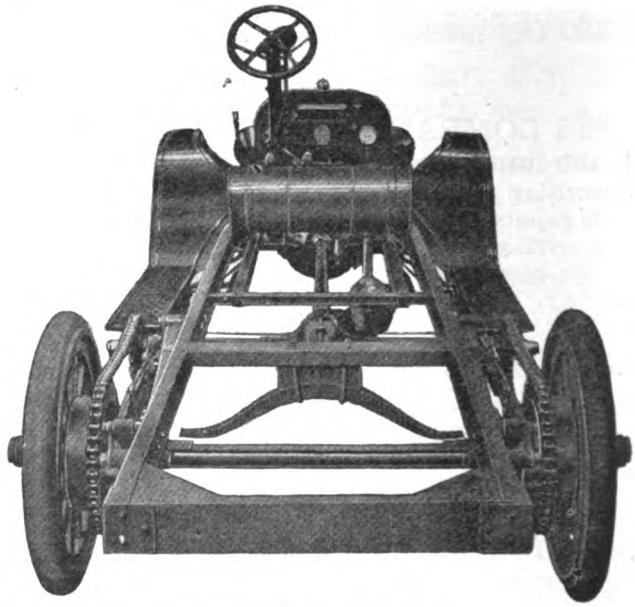
Orders are now coming into the general offices of the company in the Adams Express Company building on Dearborn street, Chicago, at the rate of 50 to 100 daily. Dealers are being secured without trouble in all sections of the country. Branch offices have been established in New York, Atlanta and Chicago and on the Pacific Coast. Work on a new factory to cost $150,000 has been started. The factory will be built on property recently acquired at 63d street and 56th avenue, Chicago, Ill. The present home of the company was opened August 10, 1915, at 411 North Claremont avenue. This will not be abandoned until production has been started in the new factory at Clearing.

Since December of 1915 a large sales staff composed of men formerly identified with other automobile concerns has been organized. S. D. Porter, who for ten years was connected with the McCormick Harvesting & Machine Company, International Harvester and later supervisor for the United States Motor Company, and the Maxwell-Briscoe Company, was brought into the organization as general sales manager, and the services of Charles E. Stuart, former sales manager of the Michigan Buggy Company, were enlisted as assistant sales manager. Stanley H. Twist, well known in both local and national advertising circles, was made advertising manager. With this organization behind it, the truck has scored a sensational success. Representation has been secured by the company all over the United States. The Smith Form-a-Truck attachment makes a complete one-ton delivery truck when installed on a Ford chassis. The retail price is $350 f. o. b. Chicago. It forms practically the rear half of the motor truck. The frame is 14 feet in length and when attached to a Ford chassis, gives a body space of eight feet ten inches back of the gasoline tank. The method of attaching makes the Ford frame a sub-frame, and gives the combined frame far more strength and solidity than the original chassis of the car.



The Ford engine and transmission are the equal, if not superior, of any on the market to-day, but the frame and rear axle assembly are not intended for "dead weight" loads. The Smith Form-a-Truck takes advantage of all the Ford's good qualities and adds to them a truck attachment that will carry "dead weight" loads of one ton and over. The Form-a-Truck frame of 4-inch channel steel telescopes and reinforces the Ford frame. The two frames are bolted directly together at the front and at the side, and at the rear the Ford frame is riveted to a steel cross member on the Form-a-Truck frame, insuring great strength and rigidity. The new frame is supported in the rear by carefully designed springs resting on a solid 2x1⅝-inch axle, equipped with roller bearings and heavy truck wheels, with Firestone solid rubber tires. There is a heavy relief or bumper cross spring over the axle to take care of overloading.

The Form-a-Truck is so designed that practically 90 per cent. of the load is carried on the rear axle, and only about 10 per cent. is carried on the Ford front axle and wheels. The rear axle assembly of the Ford is converted into a jack shaft and rigidly attached to frame by especially designed hangers. The Ford wheels are replaced with heavy sprockets which transmit the power to the rear wheels by double side chains. Emergency brakes, ample to handle loads on heavy grades, are provided on the rear wheels. This combination produces a solidly built one-ton truck with the simplicity, dependability, and low maintenance cost of a Ford delivery car. Every piece of material entering into the construction of the Form-a-Truck is of the highest grade, and the parts are assembled by the best mechanics. The same careful attention to detail, mechanism and workmanship is exercised as in the construction of high-priced motor trucks. Smith Form-a-Trucks have been in service for two years. None has gone wrong, according to officials of the company. They cost no more to operate than a Ford touring car. They now are being used as stage coaches in the Western mountains, and heavy trucks as well as light delivery vans.



One great field of usefulness which makes the Form-a-Truck exceedingly popular with business men is its adaptability in converting used Ford cars into one-ton delivery trucks. Every owner of a Ford runabout or touring car, the body of which is beginning to show wear, and the purchase of a new car is contemplated, is now given the opportunity to convert it into a useful truck at the small outlay of $350. Specifications of the Smith Form-a-Truck attachment:

Carrying Capacity—2,000 pounds.

Frame—Length 168 inches, width 32 inches, 4-inch channel, rolled steel.

The Attachment.

Showing the Complete Chassis.

Axle—2x1⅝ inches. Roller bearings.

Springs—Semi-elliptical, 2 inches wide, 42 inches long, 10 leaves. Bumper cross spring.

Wheels—Heavy artillery type, twelve 2-inch spokes, 32x3½ inches.

Tires—Firestone solid rubber, 32x3½ inches, pressed on type.

Gear Ratio on Sprockets—20 teeth on jack shaft, 42 teeth on rear.

Drive—Baldwin chains, heavy roller type; ¾-inch diameter roller, ⅝-inch wide, 1¼-inch pitch.

Brake—Emergency on rear wheels, expanding type in drums operated by hand lever; 12-inch drum, 2½ inch shoe, fibre lined.

Loading Space—9 feet or more back of seat, depending upon body.

Wheel Base—When attached to Ford chassis, 125 inches.

Tread—56 inches, center to center of wheels.

Weight—Form-a-Truck attachment, 1,000 pounds; attached to Ford chassis complete, 2,000 pounds.

The company is working out details of its plan for a national advertising cam-

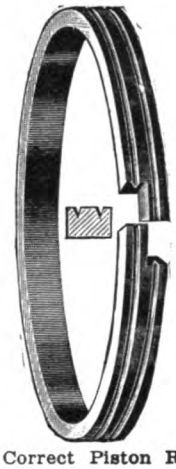
paign which will be inaugurated in the near future.

Woodworth Treads and Overshoes.

The recent increase in the price of tires makes it more important than in the past to prolong the life of the tires to the greatest possible extent. Woodworth Treads and Overshoes made by the Leather Tire Goods Company, of Niagara Falls, N. Y., can be used over any make of tire and will not only prolong the life of the tires but will eliminate punctures and do away with the bother of chains for wet and muddy roads. Woodworth Treads have been on the market for many years and differ from all other tire covers on account of being held with coil spring fasteners which automatically adjust them on the tire. The overshoes are of comparatively new design and are held on the tires by fastening to the rim. Both the treads and overshoes are made from especially water-proofed leather studded on the middle portion with steel rivets. These tire covers can be used over old tires to retread them after they become worn thin on the middle or can be used over new tires in which case the tires being protected from all outside injury and road wear will last much longer than if run bare. The

overshoes have very little effect on the speed or resiliency of the tire.



Automobile owners who are interested in protecting their tires should write to the Leather Tire Goods Company at Niagara Falls for full information in regard to these covers.

Twin Spring Shock Absorbers.

These are described as "supplementary" springs instantaneous in their action. The principle and result obtained is entirely different from the so-called shock absorbers, as these springs are free to act in every way in conjunction with the leaf spring. They not only leave the leaf springs free to perform the work for which they were designed, but they assist them to perform that work. These springs are especially made for Ford, Dodge, Overland, Maxwell, and in fact all cars, and good agents are wanted for these springs throughout the country. Write for agents' proposition and prices direct to the Twin Spring Company, 998 Boylston street, Boston, Mass.

Improved Piston Ring.

A few years ago when building water pumps for pumping water to the city reservoir a fabric packing was used to prevent water leaking past the piston. The improved water pump, such as is used to-day, has no fabric packing. A copper jacket is put in the cylinders, one or more grooves are cut around the piston. In operation the grooves soon fill with water, the volume of water in the grooves acts as a packing against the small particles of water, making a water packing against water. This principle is

A Correct Piston Ring.

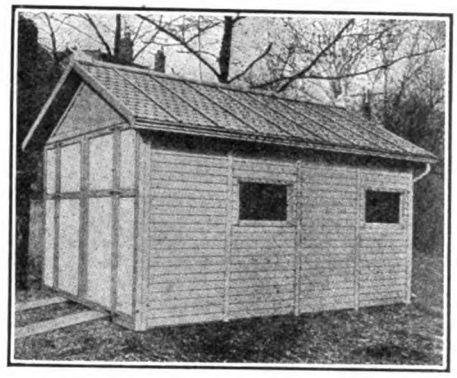
embodied in a piston ring manufactured and sold by Automobile Accessories Company, 816 West North avenue, Baltimore, Md.

This ring is made in one piece, individually cast, concentric. It is cut step-lap with a groove running between the sliding face forming the lap and the side of the ring. In operation the grooves soon fill with oil; when once full they cannot take up more, therefore, the surplus oil is forced back into the crank-case. It is plain to be seen there will be a great saving in oil yet perfect lubrication. By saving the oil and keeping it out of the firing-chamber there will be little or no carbon. The spark-plugs and valves will keep clean, the gas cannot escape because the valves are clean and seat themselves perfectly, the oil in the grooves prevents the escaping of gas past the rings; therefore the motor will have maximum power all the time. Many of the large builders have adopted the rings after testing them out for a number of months, finding the principle to work satisfactorily, the results to be lasting and also finding it economy on account of the great saving in oil and gasoline. The cost of these rings is about the same as any well made rings of the plain type.

Valuable Graphite Products.

The above is the title of a booklet which has recently been brought out by the Joseph Dixon Crucible Company, of Jersey City, N. J., the well known graphite specialists, and it includes all the various lines of the Dixon greases for automobile and other uses, also Dixon's axle grease, pipe joint compound, belt dressing and leather preservative, Silica-Graphite paint, stove cement, graphite brushes for electrical use, and many other specialties. This booklet will be sent free on application.

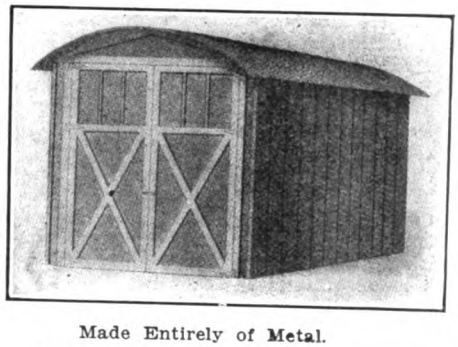
New Electric Clutch.



The Vesta Accumulator Co., Chicago, is bringing out a new electric clutch, which combines the functions of a generator, clutch and transmission, and starter. It has an unusual feature in that the commutator brushes are pressed directly against the commutator at high speeds, giving a positive mechanical connection for direct drive.

New Car Heater.

With the idea of providing for Ford cars a heater that will be moderate in price and at the same time efficient in operation, the Home Light Co., 3,353 Milwaukee avenue, Chicago, Ill., is introducing the Bridges heater, listing at $2.50. The heater takes the exhaust from the motor and is attached to a new floor board for the car.

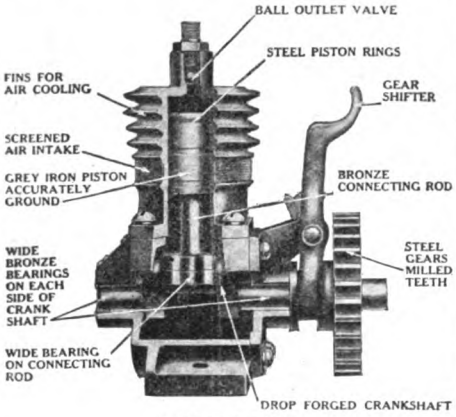


A Line of Garages.

The Moeschl-Edwards Corrugating Co., of Covington, Ky., are making a line of portable and other garages to suit all or any needs. Illustrations of two models are shown herewith. Stock garages are not as ornamental as their special designs. They are, however, made from the same material and in standard sizes. All parts being standard, they are able to make them up in large quantities and

Plain but Neat.

make shipment the same day on which they receive the order. The portable garages are made in sections and can be erected very quickly by anyone who can read simple instructions and understand plain drawings. The portable garage can be erected in four to five hours, where it takes twelve to fifteen to erect the standard. The standard is intended as a permanent building, while the portable can be easily taken down and



Made Entirely of Metal.

moved. The exterior covering of all their garages is made of heavy galvanized metal pressed into ornamental shapes and is attached to either structural steel or wood frames. Buildings covered with sheet metal comply with the building codes everywhere and take same rate of insurance as concrete, brick and stone. For full information and prices address the firm as given above.

A New Tire Pump.

The addition of a single cylinder model to their line of tire pumps is announced by Manzel Brothers Company, Babcock street, Buffalo, N. Y. This new model, like all other pumps built by this company, is all metal. The cylinder, crank case and piston are made of fine gray iron, connecting rod and crank shaft bearings are bronze and steel piston-rings are used. The crank shaft is a drop-forging. The cylinder has a bore of 1¾" and the piston a stroke of 1½". The air intake and outlet on this model are on the same principle as on their well known two-cylinder pump. The air is taken into the cylinder when the piston is at its lowest point through holes in the side wall. These holes allow just sufficient air into the cylinder and are automatically closed by the piston the moment it begins its upward stroke. This gives the greatest possible efficiency, as all of the air must go out through the outlet valve. Particular attention is called to the wide bearings on the connecting rod and also on each side of the crank shaft. The pump is furnished with complete fittings ready for immediate installation to the various cars. These fittings are designed so that the pump can be installed without doing machine work of any kind, removing the radiator or altering the car.

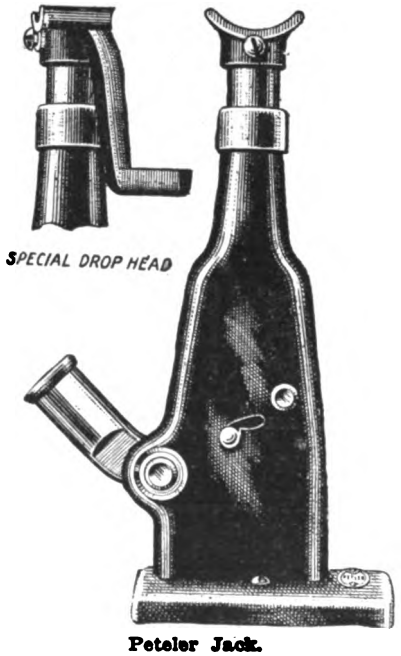
Sectional View.

The pump is sold for $12 with fittings for all cars excepting the Buick, Overland, Dodge and Chevrolet. These models are sold for $10.

The Badger Steam Vulcanizers.

These very practical vulcanizers are manufactured by the Tire Repair Equipment Co., 740 Johnson St., Appleton, Wisc. They have just made an important announcement to the trade which states that on and after January 15th, they will distribute their vulcanizing equipment on the time payment plan to all garage men and buyers who desire to purchase on these terms. This is a new departure in the sale of vulcanizers and it ought to attract, as it doubtless will, a large volume of business.

Perfection Multiple Piston Rings.



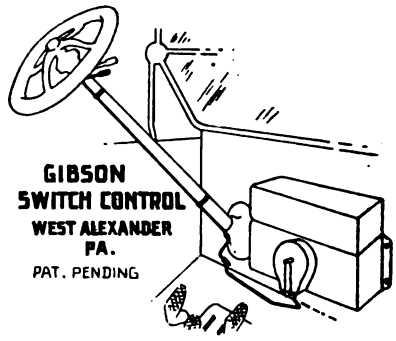
This represents a new type of piston ring, and it is claimed that they will save power and money for the car owner. These rings are made of 1-16" sections of special soft elastic steel. The openings in the various sections come at different points, causing the ring to always present a barrier to the escape of gas from the firing chamber. The equal spring tension at all points gives a perfect bearing on the cylinder walls. These rings are easily applied. They cannot be broken in putting on. They cause less friction, save power, reduce carbon and keep down gasoline repair bills. Good agents are wanted throughout the country. Write for prices and discounts to the Automobile Construction & Engineering Co., 45 North 7th Street, Philadelphia, Pa.

Process for Filling Scored Cylinders.

The Wilkes-Barre Welding Company, No. 6 West Ross Street, Wilkes-Barre, Pa., have a very successful process for filling scores in cylinders caused by loose wrist pins. They use a hard material composed largely of nickel and smoothed down to the face of the cylinder. The composition used has unusual heat resisting qualities and it is hard when applied. It forces its way into the pores of the iron, amalgamating with it and becomes a part of the cylinder and can never work out under any circumstances. This process is absolutely guaranteed and the work is turned out the day after it is received. The charge for doing this work is nominal and the same company also does oxy-acetylene welding on all kinds of automobile parts.

The Peteler Jack.

Illustrated herewith is a new automobile jack which has been placed on the market by Moreau & Pratt, Inc., 1834 Broadway, New York City. In this jack the power is transmitted from the handle directly to the lifting bar of the jack, thus avoiding a multiplicity of parts. The pawls are of hardened steel and the wear on the step is distributed as the lifting bar turns freely. When a jack is removed from under the car after the tire has been inflated the lifting bar is usually too high for use next time a blowout is experienced, because the flat tire reduces the distance between the axle and the ground. For this reason it is usually necessary to lower the lifting bar considerably the next time the jack is used, and in the average jack this necessitates working the handle up and down until the desired height is reached. A feature of the Peteler jack is that the lifting bar automatically drops to its lowest position the minute the weight of the car is removed from the jack. An automatic drop bar makes it so that the pressing of a button on the side of the jack gives instant reverse.



Peteler Jack.

The list price of the jack is $3.50 and a special head or low hung step for cars with low hung axles may be obtained for 50 cents additional. Pressed and hardened steel is used, no cast iron entering into the manufacture of the jack, and no screws or cotter pins are used in the working parts. The jack is finished in baked black enamel and nickel. It has attracted considerable immediate trade attention.

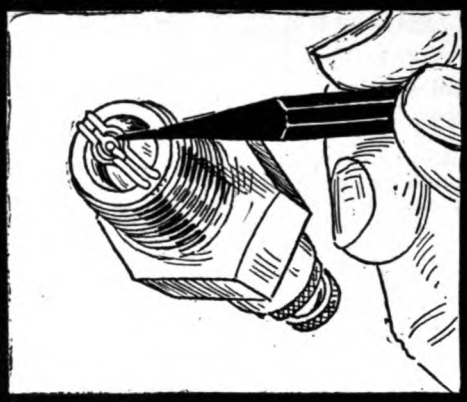
Gibson Switch Control.

This is a new device especially for Ford cars. It is especially designed to render the steering of the Ford car easier, also more positive and convenient, and it has been welcomed alike by expert and beginner. It bridges the gap between the driver and his motor by a touch of the finger, and enables the driver to throw the switch to any position instantly without removing his hand from the wheel or his eyes from the road. It is claimed that this device will save its cost in brake lining and gasoline in a short time. It only weighs 14 ounces, can be easily and quickly attached, and it is inconspicuous and entirely out of the way. This device is for sale by all dealers, or will be delivered by parcel post anywhere in the United States on receipt of the retail price, which is $2. The manufacturers also offer money back if the car owner is not entirely satisfied. Liberal discounts are offered to the trade. This specialty is manufactured by the Gibson Control Company, West Alexander, Pa., and they will be glad to mail full particulars to any of our readers.

Remarkable Performance of the Simms Generator.

The following telegram, which is self explanatory, was received January 14 by the Simms Magneto Co., of East Orange, N. J.:

"Simms Magneto Company,
"East Orange, N. J.



"Stock 1916 Maxwell "25" touring car running under A A A sanction completed total mileage of 22,022.3 miles over the road on the morning of January 5th. The Simms Magneto and Simms Generator performed perfectly throughout entire distance and were in perfect condition at completion of test. Car was stopped voluntarily by us. Was started within 50 seconds after stopped and starter worked perfectly. Car has been run 2,000 miles since the 5th without touching magneto, generator, starter or any other part of machine.

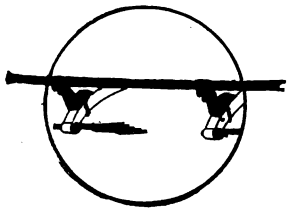
The Improved Humidifier.

This is a new device for increasing the efficiency of the motor on any automobile. It automatically supplies moisture to the carburetor, and it is claimed that this makes the pressure in the cylinders, following the explosions, more elastic by lengthening the period of greatest effectiveness. The manufacturers claim this device will save 10 to 40 per cent. of gasoline, increase the power of speed and the first cost of the invention is the only cost as it is durable and entirely automatic, and can be easily attached to any make of automobile. This attachment is manufactured by the Improved Humidifier Co., 612 Michigan Ave., Pueblo, Colo.

Reflex Spark Plugs.

Dealers will be especially interested in the new selling plan for Reflex Spark Plugs, which has been adopted by the Reflex Ignition Co., 1711 Payne Avenue, Cleveland, Ohio. These plugs are good sellers on account of their high quality. They are fully guaranteed against defects in material or workmanship. Any plug that proves defective will be repaired or replaced free of charge with money back if the car owner is not entirely satisfied. A sample Reflex plug will be sent free to any dealer who will take the trouble to write for it, stating on his letterhead the size thread required. Free display cabinets will also be furnished to dealers handling these plugs, and circulars, signs, and other sales helps are also included in the selling plan. We advise correspondence without delay, as open territory is going fast, and readers who are interested should write, or wire manufacturers at once.

The Kimball Steel Protector.



This is a device for the protection of tires, which not only lengthens the life of the tires, but, it is claimed, makes blowouts, punctures and rim cuts impossible and the tires are as flexible as ever. The same company also manufactures a mud chain which can be put on in a jiffy with one hand while standing on the run board. If you get into a mud hole this will get you out of the scrape in no time. It is only necessary to hook the ends of the chain together and pull the lever, and they are on tight. This chain is also good as an emergency repair for blowouts. Both these specialties are manufactured by the Kimball Tire Case Co., 174 Broadway, Council Bluffs, Iowa.

A Good Auto Top Roof Cover.

A good roof cover, at the very low price of $5.95 for a roadster and $7.95 for a touring car, is offered by the Split Hickory Wheel & Top Co., 1196 Sycamore Street, Cincinnati, Ohio. This roof cover will be sent parcel post paid at the price named, and the same company manufactures other covers up to $14. These covers are easy to adjust and will save two-thirds of the price on a new top. The same company also sells a line of Ford front springs $2.30, rear $6.50. They also build new auto tops and wheels, and repair old ones, and they have a free catalog which they would be glad to send to any who are interested. They also want good agents and dealers throughout the United States.

The Hartford Bumper.

This Bumper bolts on without drilling. Once on, it's as firm as Gibraltar and your car's lamps, mudguards and radiator are rendered immune from damage from bump or collision. It is a real shock-absorbing bumper. Two frictionally operating spring steel arms absorb the bump and jar of any impact. This takes all strain off the car itself. Special

Low Cost But High Quality.

Ford type $10. Large size for cars of 3,000 pounds or over, $15. Medium size for cars from 1,500 to 3,000 pounds, $12.50. Small size for cars up to 1,500 pounds, $10. Bross, nickel or black enamel bar supplied without extra charge. This device is made by the Hartford Suspension Co., 141 Morgan St., Jersey City, N. J.

New Welding Equipment Catalog.

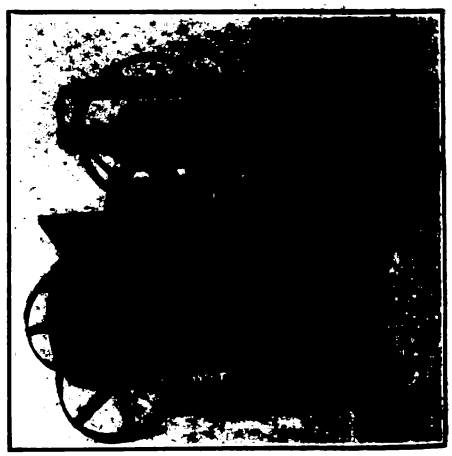
We have just received their latest catalog on oxy-acetylene welding equipment from the Imperial Brass Manufacturing Co., 520 So. Racine Ave., Chicago, Ill. This catalog gives prices and full particulars on all articles in this line which are manufactured by the Imperial Company and contains a fund of valuable information for anyone who is using welding equipment or contemplates installing equipment of this character. This interesting illustrated catalog will be sent free of charge to anyone who will take the trouble to write for it.

Spindle Arm Silencer for Ford Cars.

This is a device which absolutely stops the rattle in the spindle arm of a Ford car and it is claimed that it will also stop the wear. It helps in steering the car. There are no nuts or bolts to take out. The attachment is put in from the front side with nippers and once there it will stay. The illustration will give an excellent idea as to the appearance

of this device. It is manufactured by J. W. Sanborn Mfg. Co., Hampstead, N. H., and will be sent to any one postpaid on receipt of the price, 50 cents per pair.

Cut Your Own Washers.



Every automobile repairman has occasion to use a great many felt washers, and to fill a long felt want in this respect the Advance Felt Specialty & Cutting Co., 159 W. Harrison St., Chicago, Ill., have brought out a machine with which any repairman can cut out his own washers instead of buying them from the supply house. With this machine you can select the goods desired from your own stock, and cut the size washer you want for any car in a minute, at the maximum cost of a few cents, and the advantages of such a machine is too obvious to need comment. The same company is also prepared to furnish felt washers of every description for the trade, and they invite your correspondence and orders not only on their line of washers but also on the very handy machine referred to before.

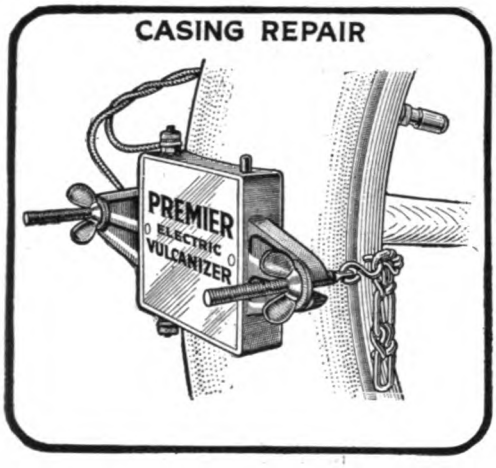
New Norma Precision Bearings.

We have received from the Norma Company of America their new booklet entitled "Norma" Precision Bearings. This is a work that is helpful to engineers and of some permanent text book value aside from the listing of the regular Norma Bearings which it contains, and anyone who is not informed on antifriction principles may get his facts from the first eighteen pages of this booklet. Following the text matter comes sixty pages of tabulated data, revealing the exceptional scope and completeness of the Norma line. This booklet, or catalog, will be mailed free of charge to any dealer, garage man or engineer who will take the trouble to write for it to The Norma Company of America, 1790 Broadway, New York City.

U. S. Two-Stage Air Compressors.

The accompanying cut gives a fair idea of the appearance of the U. S. Two-Stage

A Guaranteed Air Compressor.



Air Compressor, which is made by the United States Air Compressor Co., 6534 Carnegie Avenue, Cleveland, Ohio. The manufacturers state that this air compressor starts quickly without strain and runs smoothly and quietly. The load is divided between high and low pressure cylinders, and there is practically no wear-out or repair expense. This machine is put out to garages on 30 days' trial and it is sold with an unlimited guarantee and on terms to suit the convenience of the purchaser. Many of our readers will doubtless find it profitable to investigate.

Battery Improvement.

In the endeavor to prevent buckling of the plates of its storage batteries, the Vesta Accumulator Co., Chicago, Ill., now makes use of celluloid clamps attached to the edges of the plates to hold them securely in position. These "Isolators" were first disclosed at the Chicago show, where the new Vesta storage batteries were exhibited. They are made of heavy celluloid and are said to in no way cut down the capacity of the battery.

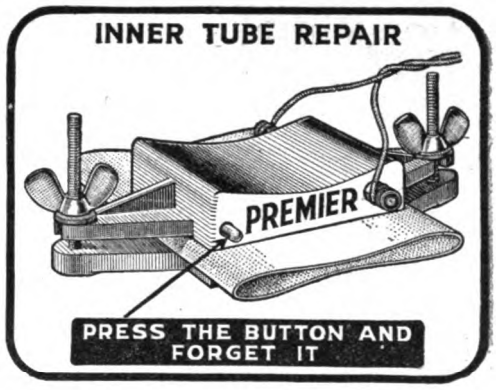
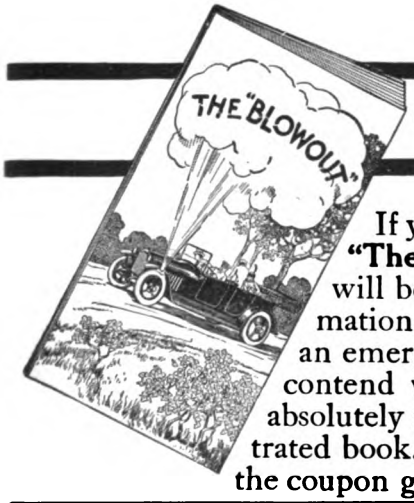
Vulcanizing Made Easy

The **"Premier"** vulcanizer operates under all weather conditions. No gasoline to measure or open flame to blow out in the wind. With the **"Premier"** you simply make preparations for the repair, stick on the vulcanizer and press the button. This requires about three to five minutes and no further attention is necessary, for when the repair is vulcanized the button is automatically released, which cuts off the current and the vulcanizer then cools off. The **"Premier"** is furnished to operate off any voltage storage battery or 110 volt lighting circuit. Price $3.50 for the complete outfit. **Ask your dealer** for this **real** vulcanizer.



PREMIER AUTOMATIC ELECTRIC VULCANIZER



$3.50

No watching is necessary as the fire and explosion danger is eliminated. The **"Premier"** vulcanizer cannot burn your repair, garage or automobile. It uses no dangerous fuel which prevents safe use in the home or garage. Just a quick, convenient, economical, clean process of vucanizing.

DEALERS:

Sell your customer a vulcanizer that is safe in every way. Remember that if you don't handle the *"Premier"* you have got to *compete* with it.

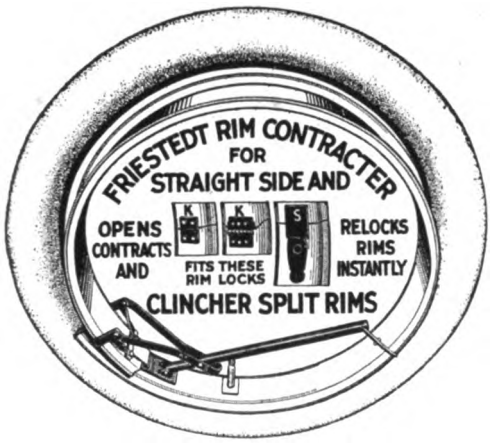
Automobile Trade Names.



The Trade Circular Addressing Co., 166 West Adams Street, Chicago, Ill., is in a position to furnish to the trade names of automobile dealers, garages, repair shops, supply dealers, tire dealers, Ford dealers, Ford owners, and almost anything required in this line at reasonable prices. This company has been in the mailing list and letter business for 32 years and operates a large plant employing over 300 people. They are also prepared, if it is required, to do addressing, mailing, printing, furnishing envelopes, and in fact everything in connection with mail work in this trade.

The Mosler Vesuvius Plug.

One of the great advantages of this spark plug is found in the fact that it is has circular knife-edge electrodes, which give a "ribbon of flame," exploding all the gas and developing all the power of the motor. The wire in the Vesuvius Plug is adjustable, and once the gap is set it will not change, as it is anchored at both ends and no expansion can affect it. The manufacturers call this the indestructible plug and they claim it will outlast the motor. This plug is manufactured by A. R. Mosler & Co., New York City.

The Friestedt Rim Contractor.

This is an excellent tool for straight side and clincher split rims. It opens,

contracts and relocks instantly, and the cut will give readers an excellent idea of how this tool is used. The Friestedt Contractor fits Baker, Kelsey and Stanweld split demountable rims. This is a specific tool and not a makeshift to operate all rims. It will do in a second what it would take a longer time for you to do under ordinary circumstances. This article is placed on the market with an unusually strong and unequivocal guarantee. Readers are urged to write for complete information and prices to the Friestedt Rim Contractor Co., of 2931 W. Lake St., Chicago.

Evèrready Company Announces a Ford Starter.

A new electric starting and lighting system for Ford cars has just been announced by the American Ever Ready Works of Long Island City, makers of the Everready Non-Sulphating Storage Battery, also Everready Flashlights, Dry Cells and other products well known in the motoring world. Mechanically the new starter is based on the principle that a starting system should be located on the center line of the car where it cannot exert a side-pull on the crank shaft or develop any other strain which the Ford car was not designed to withstand. The only possible position in which a center hung starter of this kind can be placed is in front of the radiator directly on the end of the crank shaft, and it is there that the Everready Starter is located.

This position is regarded as of fundamental importance by the Everready Engineers. It not only prevents side strains on the crank shaft, but it does not disturb the three point suspension of the car, which is one of the important points in Ford construction. This balance is carried even to the storage battery, which is made in a flat shape and placed against the front seat, instead of being on the running board or on one side of the car. The position of the Everready Battery not only preserves the three-point balance of the car, but protects the battery from shocks and the low temperature of winter months. It is also claimed that because the Everready Starter is in front of the motor it eliminates considerable vibration in the same way that the second flywheel found in the front of the motor in one of the best known English cars gives that car the smooth riding qualities for which it is famous.

Another point in which the new starter differs from the usual design is that it runs at engine speed instead of turning at a two or three to one ratio. Tests have shown that instead of dragging on the motor and giving the car less power, the new starter makes it get away more quickly, adds to its power on hills, and makes it possible to throttle down to three miles an hour on high. Driving direct on the crank shaft through a flexible coupling, there are no chains to get noisy or break.

The entire system is enclosed in a small black enamelled case and can be attached in about an hour by any garage man without removing any parts. With it is supplied the well-known Everready Non-Sulphating Storage Battery—absolutely guaranteed against sulphating, perhaps the commonest of battery troubles.

Motor Trucks on Farms.

It is estimated that motor trucks are now being used by over 4,000 American farmers. This is about four per cent. of the total number of trucks sold in the United States. These vehicles nearly all have been bought within the last two or three years, indicating a swiftly proved economic success, a supposition strengthened by a careful canvass recently made by the Kissel Motor Car Co.

New Wheel Puller for Fords.

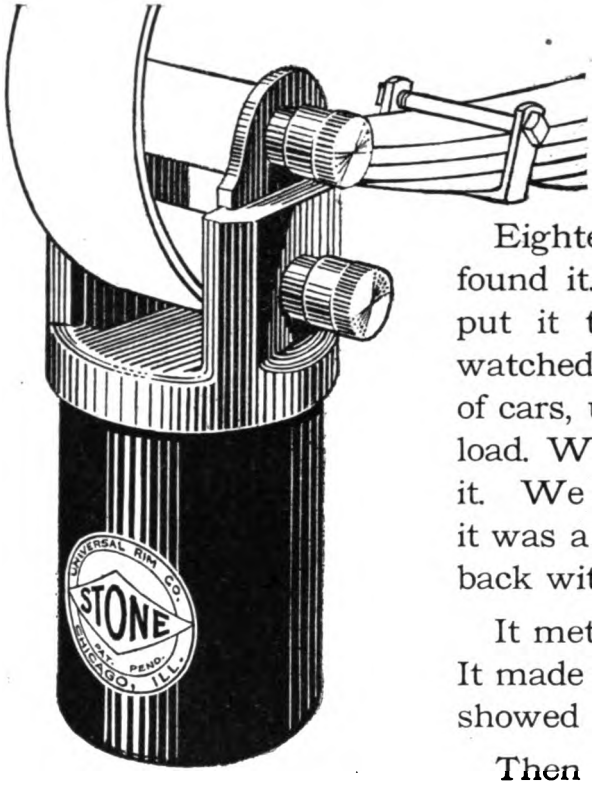
The quantity of Ford cars on the road has brought into existence a few special wrenches and tools that are fast becoming standard. The wheels on automobiles have a way of sticking fast to the axle on many occasions and when fast work is desired a wheel puller is an absolute necessity. Mossberg "No. 660" wheel puller overcomes several objections to the first designs of this device. It screws on to the hub threads with the very wrench that removes the hub cap and hub nut, and then a "grip clamp" is provided so that however hard the pull, the threads on the wheel hub cannot be stripped. An ordinary wrench applied to the square head shaft of the puller thrusts this shaft directly against the end of the axle. Sometimes the wheel gives gracefully, but in many cases, it is impossible to start it and the "660" is so made that a few taps of a hammer brings the most obstinate wheel on a Ford car. This hammering cannot harm the hub or puller itself because the shaft bolt is free running in the puller head,

Mossberg, No. 660, Wheel Puller for Ford Cars.

being retained by a square nut inside. Mossberg lists this at 56 cents and announces a new catalog of tools free upon request. Address Frank Mossberg Co., Attleboro, Mass.

Rhoades Ignition System.

The New York Coil Company, 338 Pearl Street, New York, now supply with their New Rhoades Ignition System the non-vibrating transformer coil with a back board of such size that it fits perfectly the space formerly occupied by the four-cylinder regular Ford coil box. Holes are drilled in the box which exactly register with those already in the dash, so that it is unnecessary to bore new holes to install the system. This is even true of the holes already through the dash, through which the necessary wires are run, reducing the labor of installation to a minimum. The new system is also supplied with a metal tube with proper



fastenings for supporting the wires in a workmanlike manner. All wires and cables are supplied, which are of an unusually high grade construction, equipped with terminals, and connected to the system so that the owner has simply to snap the terminals on the spark plugs. This also avoids the possibility of improper connections. The price of the system complete, including sparker, coil with kick switch, elevating gear bracket, and, in fact, every necessity, is $20, fully guaranteed.

Stone Shock Absorbers

The Story of the Stone

WE SAW ROOM for a superior shock absorber—one which would prove as supreme in its field as our Baker Rim has proved among rims.

Eighteen months ago we believed that we had found it. But we wanted to make sure. So we put it to the test. For a year and a half we watched its performance. We tried it on all kinds of cars, under every possible condition of road and load. We had many others try it. We did not spare it. We wanted to know beyond any doubt that it was a shock absorber which we could afford to back with our reputation—and our money.

It met our demands—exceeded our expectations. It made riding virtually a new sensation. And it showed a surprising strength and endurance.

Then we set to work to find out how little we could make it for.

Quality

$10.00

Price

We found that we could produce it, using the best materials, skimping nothing, and sell it to car owners for $10, leaving a good profit for dealers.

A Sensational Seller

This Shock Absorber at this price is proving a sensational seller already. We are going to advertise it heavily. Men in your territory will be looking for it. Don't let other dealers get this business away from you. Act quickly. Be ready first. Write to your jobber today for prices, terms and descriptive matter. If he cannot supply you, write us. Address Dept. 12.

Made and Guaranteed by

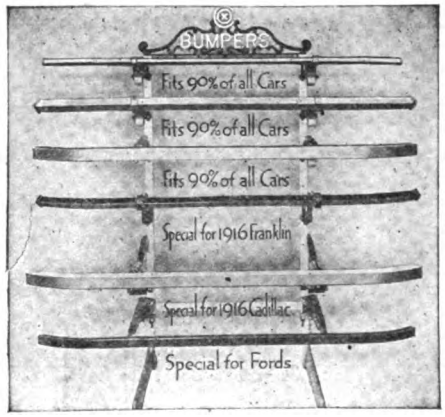
Premier Motor Car Company in New Hands.

A syndicate with a cash capital of $2,500,000 has purchased the assets of the Premier Motor Car Company, of Indianapolis. They have acquired the large and modern Laycock plant in Indianapois, where cars will be manufactured on a large scale, and it is said that the capacity of the new plant, when fully equipped, will be at least 10,000 cars a year. The syndicate which has made the purchase is composed of bankers and manufacturers from Detroit, Mich., Joliet, Ill., and Indianapolis, Ind. The men behind the enterprise are J. C. Flowers of the Gerlach-Barklow Company, Joliet; E. W. Steinhardt, a prominent automobile merchant of Indianapolis; C. F. Jensen, president of the Vanguard Manufacturing Company, Detroit; F. W. Woodruff, vice-president of the First National Bank and the Woodruff Trust Company, Joliet; George Woodruff, President of the First National Bank of Joliet and President of the Illinois Bankers' Association, Joliet; T. R. Gerlach, Vice-President of the Gerlach-Barklow Company, Joliet. Officers of the new Premier Company have been announced as follows: President, J. C. Flowers; Vice-President, E. W. Steinhardt; Secretary, C. F. Jensen; Treasurer, F. W. Woodruff; Directors, T. R. Gerlach, George Woodruff and H. F. Thompson. The Premier cars are already favorably known to the trade and the public, and under its new management this company will undoubtedly enjoy an increased prosperity.

So-Luminum.



This is the name of a remarkable aluminum solder which is manufactured by the So-Luminum Manufacturing & Engineering Co., 1790 Broadway, New York City. When bits of aluminum are lost from aluminum parts, in a very few minutes the missing portions may be built in to crank-cases, manifold pipes,

etc., with So-Luminum. The accompanying cut shows a photograph of a crank case before and after using. In repairs of this character, if given the hammer test, it will be found that the new part built up with So-Luminum has twice the strength of the old portion and is much harder. This solder is used by the United States army and navy, Vickars, Ltd., of England, the Davis-Bournanville Welding Company and many other large manufacturing and welding concerns. So-Luminum runs at very low temperature, requires no flux, is non-oxidizing, and the only thing required in connection with it is a gasoline torch or gas blower. A lug can be built on a manifold pipe, or other parts, in anywhere from ten to twenty minutes. This product is not a soldering iron proposition, as the solder is too hard and strong to make the soldering iron feasible, and yet it runs at very low temperature and tins very easily. It is claimed that this method of repairing takes the place of welding and the work can be performed in one-fourth the time. Full particulars and prices will be furnished by the So-Luminum Manufacturing and Engineering Co.

To Display Bumpers.

The Cox Brass Mfg. Co. of Albany, N. Y., is offering to the trade, as a dealer help, a very good looking bumper display stand, carrying six bumpers.

Bumper Stand.

The stand is included with an order for six bumpers which comprise the standard round, diamond and channel rail type with the E-Z Clamp On which has long been a feature of the Cox product, a special bumper made for the 1916 Cadillac, special for the 1916 Franklin and the Ford. The stand is well balanced, with aluminum finish, the Cox insignia and the word "Bumpers" nickel plated at the top. The height of the device is 5 ft., depth 2 ft. 2 in., length 5 ft. 4 in. It has proven an excellent display for the dealer who goes after the bumper trade.

Trade in Your Old Typewriter.

A very interesting offer is made in our advertising columns by the Fox Typewriter Co., 6602 Front Avenue, Grand Rapids, Mich. If you will send this company the name, model and serial number of your old typewriter they will at once mail you their new catalog and make you a liberal exchange offer on the new Fox model No. 24 on either a cash or time payment plan. This company states that their prices are the lowest ever made on high-grade typewriters, and also that they have a new model, new price, and a wholly new policy under a new management. This is something that may be worth looking up by every business man.

Conover Cowl Dash and Windshield for Ford Cars.

This device is made not only for Ford pleasure cars, 1916 model, but also for Ford delivery cars, and it can be quickly and easily fitted on any Ford model, new or old. It gives an up-to-date appearance to the car and it is also a great convenience for the driver. This shield is of the rain-vision, ventilating type, and made for long service, of the best plate glass. The Cowl is heavy steel stamping, finely finished. This device is manufactured by the Page Woven Wire Fence Company, Windshield Department, Adrian, Mich., who will be glad to give full particulars not only on this article, but on their large line of other specialties.

Large Profits in Tire Repairing.

Many garages and repair shops make considerable extra money by repairing automobile tires, and a complete equipment for this work may be obtained from the Auto-Tire Vulcanizing Co., 140 Powell Street, Lowell, Mass. Special attention is called to their new No. 8 Adjustable Sectional Vulcanizer, which is a most efficient machine, superior in construction and economical in operation. Complete and thorough work can be accomplished with this vulcanizer at all times, and our readers will find it profitable to investigate.

Service Station for Atwater Kent and K-W.

Car owners who have the Atwater Kent or the K-W ignition on their cars will be interested to learn that E. J. Edmond Co., 1783 Broadway, New York City, who are the New York distributors for both these systems, have a very complete service station at the address named, where they will be pleased to supply old and new customers.

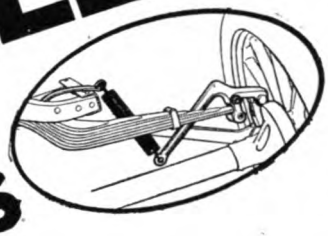
New Carburetor.

L. V. Flechter & Co., 245 West 55th Street, New York City, market the Flechter carburetor, which is claimed to embody the simplest means of varying the air supply to compensate for the increased suction at the fuel nozzle with higher speeds. A fixed nozzle or spray is employed. The only adjustment necessary is to the air supply. The Flechter carburetor is made in single and double jet types, for use according to the type of motor. The carburetor is supplied with an adjustment for air at low speed and another for high speed, in excess of 600 r.p.m. All models are provided with a hot air horn fitted with a strangling device to facilitate starting.

Braender Tires in Philadelphia.

Braender Rubber & Tire Co. now has a branch in Philadelphia. The Braender Rubber & Tire Co., with headquarters at Rutherford, N. J., have just opened a new branch in Philadelphia at 1327 Race St. This branch office will be in charge of W. L. Porter, and will carry a complete stock in standard sizes of Braender tires —Bull Dog non-skid and plain—also tubes. Mr. Porter was formerly manager of the Mutual Tire & Rubber Co., who were the Philadelphia agents for Braender tires and tubes.

Multibestos by the Foot.



The Standard Woven Fabric Co., Framingham, Mass., is again offering its Multibestos brake lining, measured off by white lines, into foot lengths, a great convenience in the sale of this popular product. This company also puts out a special Multibestos cabinet for its dealers, separate compartments being provided for all the standard widths of the product. The Multibestos rolls are slipped into the compartments, where each roll revolves on its own axis.

Now Begins a Great Campaign Advertising

AITCHANDEE SHOCK ABSORBERS

Every one of our dealers will be benefited

You Can Share in the Profits

With the first of the year began our big national drive to introduce Aitchandee Shock Absorbers to all Ford owners. It is creating a sensation. Of course many already knew of our invention under the name of H. & D. Shock Absorbers. That is what we called them during the first year, which we set aside for tests. Over 5000 test sets in every state in the Union have proved the many excellencies of our new application of the cantilever principle. No need to prove the mechanical superiority.

Now comes the 1916 model, which we have christened Aitchandee. It has several improvements. It is destined to be a leader. We know it because of the rapidity of sales before a bit of advertising was done.

Money will not be spared in making Aitchandee Shock Absorbers famous. We are preparing for a very large production.

You will be interested in our new profit basis for those who handle Aitchandee Shock Absorbers. Profits for you will be *large and quick*. We are meeting you half way, with the best proposition you ever run into.

Soon Ford owners everywhere will be wanting Aitchandee Shock Absorbers and wondering where in their neighborhoods to obtain them. We urge you to be prepared for the demand.

The quickest way to find out about our splendid proposition is to write us now, and we will send a complete description.

You can't afford to miss it.

New Sizes of Tire-Doh.

That the car owner is showing an increasing desire to repair his own punctures and blow-outs is evidenced by the rapidly increasing sales of Tire-Doh. On account of the increasing popularity of Tire-Doh, the Atlas Auto Supply Company, manufacturers, have found it necessary to get out new sizes. Heretofore Tire-Doh has been offered only in one size, retailing at $1. In addition to this size, which will be continued, the company now offers a Junior size package retailing at 50 cents, and also offers the Tire-Doh Cement and the Tire-Doh separately. Tire-Doh Cement can now be bought in 4 oz. packages for 25 cents, and the Tire-Doh alone in 2 oz. packages for 50 cents. Tire-Doh is not a new product with the jobber, dealer or the

Tire-Doh Outfit.

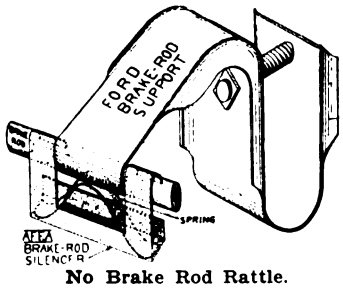
car owner. It has been on the market more than six years and in that time has undergone the most rigid tests, and, according to the manufacturers, has stood up under all of them. The manufacturers of Tire-Doh guarantee that Tire-Doh will permanently repair the smallest punctures or the largest inner tube tears without heat or tools. They state further that one of their dealers recently showed them an inner tube with a 37-inch tear in it that had been successfully repaired with Tire-Doh and driven more than 1,500 miles.

In addition to repairing punctures and blow-outs of inner tubes, Tire-Doh is most valuable in sealing holes and cuts in casings before they develop into sand blisters. According to the manufacturers, Tire-Doh is also an effective repair method for the re-seating of valve stems. The Atlas Auto Supply Company, manufacturers of Tire-Doh, have recently found it necessary to move into a much larger factory which they have purchased at 656-660 West Austin Avenue, Chicago. This company is considered one of the most successful in the field of accessory manufacturers.

Contracts for Tire Pumps.

Contracts have been given for installing the Master Engine Driven Tire Pumps as standard equipment for 1916 on the following cars: National, Marmom, Jeffery, Apperson, MacFarland and the Owen-Magnetic. These pumps are manufactured by the Hartford Machine Screw Co. of Hartford, Conn.

"The Greatest Business in the World."



That's what one of the most successful garage and tire men in the country calls his business, says F. C. Millhoff, sales manager of The Miller Rubber Co. Akron, Ohio. And before this man went nto it, three or four years ago, he had n turn been a traveling salesman in the extile field, a branch salesman for a eading auto manufacturer, and proprie-or of a small tire and accessory shop. Now he owns a string of three garages n one of our largest cities, and people speak of him as having made his pile. So we can take considerable stock in what he says.

"The greatest business in the world." How queer—yes, almost ridiculous—that statement would have sounded a dozen years ago. Then a garage was thought of as not much more than a new kind of livery stable, and a garage man a rough, ignorant jack-of-all-trades who puttered with one's car when something was the matter with it. The garage and tire man of to-day is a real merchant, says Mr. Millhoff—a business man, first and last. True, he has considerable mechanical knowledge, and he "tinkers" as of old. But most of his ability and energy are directed along modern merchandising lines, which he has found are the lines of least resistance in building his business.

The modern garage man knows the principles of salesmanship. He knows how to adapt the great tool advertising to his business. He realizes the value of his show windows, and never neglects to keep in them attractive, inviting displays which will bring the passing motorist into the store. He co-operates with the advertising efforts of the manufacturers whose lines he handles, and thus cashes in on the thousands of dollars they spend each year on national publicity. He knows the importance of keeping his shop clean and tidy. And, best of all, he fully realizes the meaning of that all-important word, service—and he talks service and gives service at all times.

The Affa Brake Rod Silencer.

Another new Affa specialty for the Ford car is to be put on the market by W. S. Graffam of Northampton, Mass. It is to be known as the Affa Brake Rod Silencer, and is for the purpose of preventing the rattle of the brake rods in their supports. It consists of a small flat spring enclosed in a retaining box which

No Brake Rod Rattle.

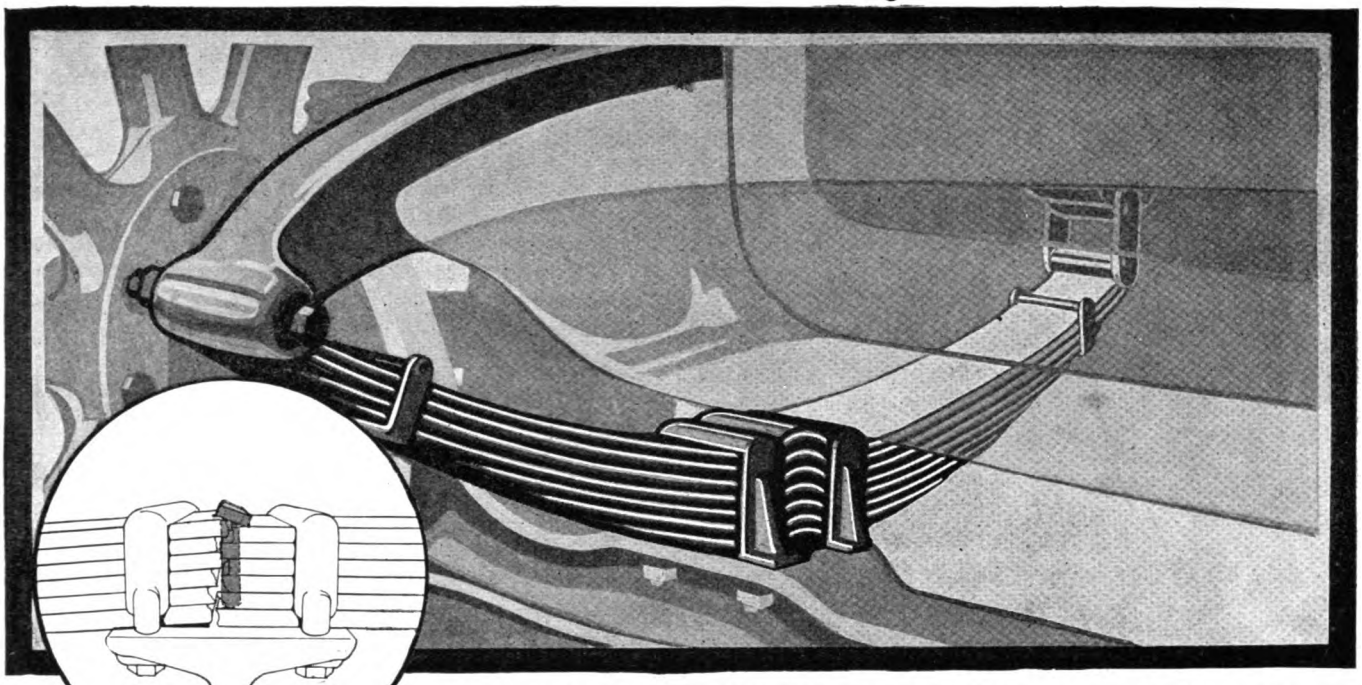
can be snapped onto the brake rod and its support in such a manner as to hold the brake rod firmly against its bearing in its support so that it cannot rattle. It has the advantages of not being necessary to remove the brake rod supports that come on the car, of requiring no tools to put it in place, of not freezing up and sticking, of being guaranteed for the life of the car and of selling at the very low price of 35 cents per set. If not found at the dealers, they will be sent anywhere postpaid on receipt of price.

Willard Storage Batteries.

The Willard Storage Battery Co., Cleveland, Ohio, have made no specific changes in the Willard line this year, except a refinement of certain details. The Willard organization is especially proud of the fact that more than 700,000 of its batteries are at present in satisfactory use. Willard batteries may be had in any size for any type or sort of service.

The Aerofram.

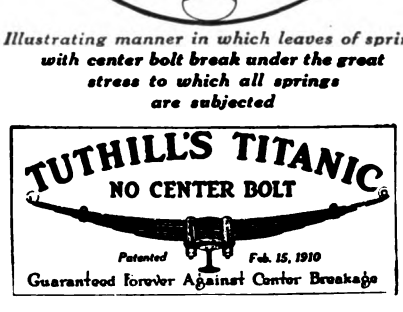
This is a new auxiliary air device which differs from most others in size, ease of application and in being automatic in its action. It has been designed and built after exhaustive tests on various motors with a vacuum gauge, and it absolutely adapts itself to the actual vacuum at each variation of speed. In practice it has always shown increased economy of operation, less fuel required, or more mileage for a given gas supply. A recent test by a large commercial house in Chicago is interesting. This



New Auxiliary Air Device.

firm uses over 100 delivery and commercial vehicles and wished not only economy in their operation, but were ready to market any device of merit to a large clientele. They had a Briscoe, 4 cylinder, 1915 model, which tested to 26 6/10 miles on 1 gallon of gasoline. Without change or alteration, and over the same course, it was tried with the Aerofram attached. The motor was first run long enough to be thoroughly warmed up, then it was run dry, that is until the tank and also the carburetor were drained. One gallon was supplied and a start was made, but trouble developed which proved upon examination to be dirt in the carburetor and supply pipe. In cleaning the carburetor and pipe some gasoline was lost, estimated at about 1 pint, but nevertheless the trial was continued with the balance of fuel and a record of 29 9/10 miles was made. This showing was so conclusive as to the merit and economy of the Aerofram that the firm immediately gave an order for 1,000 Aeroframs for their sales department, and also equipped all their own cars with them. At the present high rate of gasoline, when such economy can be secured by the use of a device costing only $1, its sale may be very large indeed. The Aerofram is manufactured by the Aerofram Company, 755 Boylston St., Boston, Mass., who will be glad to give full information.

Polson Puts Factory in Cleveland.



On account of a heavy increase in their Eastern business The Polson Rubber Co., of Kansas City, Mo., are putting a factory in Cleveland, Ohio, for the manufacture of their popular line of Blow Out Patches, Hook On Boots, Reliners, etc. The new factory is under the personal supervision of Mr. H. B. Polson and is now making shipments. Mr. C. A. Polson will continue in charge at the Kansas City factory.

Illustrating the Tuthill Titantic Spring—see the hump, without center hole or center nib

Illustrating manner in which leaves of spring with center bolt break under the great stress to which all springs are subjected

WHY springs break

Punch a hole in anything and you decrease its strength—punch a hole in each leaf of an automobile spring and you decrease its strength—weaken it to a remarkable degree.

This is especially true if the hole is punched where the spring is stressed the most—at the center—and it is a fact that such a hole increases the liability of breakage at least fifty per cent.

Tuthill Titanic Springs

have no center bolt or center nib (which is practically as weakening as a center hole). That is why we are able to guarantee them forever against center breakage.

Tuthill Titanics outlast all others—outsell all others.

You are losing a money-making opportunity if you do not sell them. Replace with Tuthill Titanics—because you can depend upon them not breaking at the center.

Send for 1916 price list—the most complete list of springs for replacement ever published. No large stock or big investment necessary. Write for the list—or get in touch with the nearest distributor.

Other dealers are building up a nice permanent business on Tuthill Spring replacements—why not you?

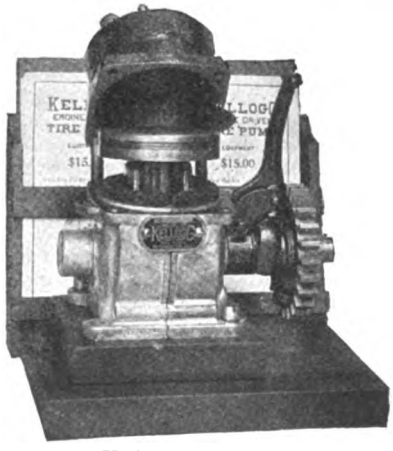
New Battery System.



The N. Y. Coil Co., New York, has brought out a battery system for use in connection with a high-tension magneto, giving the latter easy starting features. This device consists of a special type magnetically-operated circuit breaker and condenser, somewhat resembling a master vibrator. A specially constructed kick switch also is supplied, which, when turned to the battery position, places six dry cells in series with the vibrator and armature windings of the magneto. When the magneto is revolved to the position where its breaker points separate a rapidly made and broken battery current flows through the armature. This induces a vibrating spark in the secondary winding of the magneto, which is distributed by the regular distributor of the magneto to the various spark plugs in the proper firing order. When the switch is turned to the opposite side, marked magneto, the magneto operates in the usual manner. As the switch is furnished separate (with wires attached) it may be located on driver's side of dash, allowing the special vibrator to be installed on the engine side of dash in any convenient position. Price is $8.

The Kellogg Display Stand.

We illustrate herewith the Kellogg Engine Driven Tire Pump, also the display stand which is furnished to dealers by the Kellogg Manufacturing Co. of Rochester, N. Y. On this display stand the cylinder of the tire pump is tipped back and raised so that customers can see the interior construction. Folders at the back describe the pump fully and give a list of the cars which can be equipped with it. This pump makes an ideal silent salesman. The stand is furnished free to dealers. It is only necessary to specify that you want one of the model 101 pumps mounted on a display stand. Of course the pump can be taken off from the stand and sold at any time, but it is generally better to retain it on the stand for demonstration purposes. On the stand a complete line of other Kellogg specialties can also be shown.

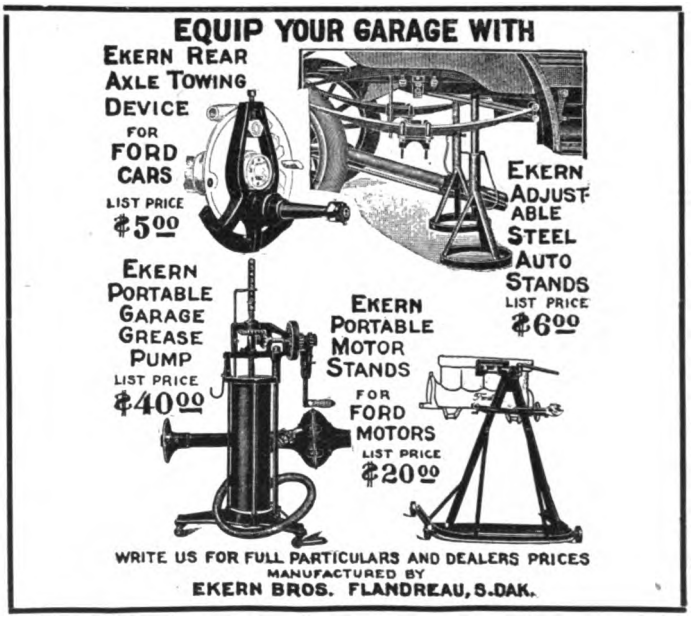
Digitized by Google

(*Concluded from page 75.*)

be laid. The four essentials for the roadbed are thorough drainage; firmness; uniformity in grade and cross section, and adequate shoulders. Where the first can be obtained in no other way it may be necessary to lift the road considerably above the surrounding land. Firmness is secured, if the road has been properly drained, by making certain that the roadbed is thoroughly compact. The sub-grade must be repeatedly rolled and reshaped until the desired grade is secured. The shoulders should never be less than 4 feet wide and not infrequently one is made sufficiently wide to form an earth roadway parallel to the brick pavement.

Strong, desirable curbing is necessary for all brick pavements in order to prevent the marginal brick from becoming displaced, which event would result in deterioration, finally spreading over the entire pavement. Properly constructed curbing, on the other hand, holds the bricks together and enables them to present a combined resistance. Portland cement and stone are probably the best materials to use.

One of the most essential factors of a brick pavement is a firm foundation upon which to lay the brick. The importance of this is evident when one considers that the ability of pavement to resist wear depends upon the smoothness of the pavement and a firm foundation. If the foundation is poor one of the bricks may be easily forced down causing unevenness in the surface. Where the traffic is comparatively light and the sub-grade composed of material that does not readily absorb water, broken stone may make a satisfactory base. For heavier traffic or where the material composing the sub-grade is at all unstable a concrete base is necessary. The stone base should be constructed much as in the case of first-class macadam roads. Concrete bases may be constructed of concrete composed of 1 part Portland cement, 3 parts of sand and from 5 to 7 parts of broken stone or screened gravel. Above the concrete base a sand cushion to correct slight irregularities and to secure an even surface for the brick is most desirable. This cushion is usually 2 inches thick, though in some cases it may be only 1½. It is important to have the sand clean, free from pebbles and dry when spread.



After the brick have been laid upon this cushion and the pavement gone over carefully to remedy all defects and remove all imperfect material, it should be rolled with a heavy power roller, gone over carefully once more, and the joints then filled with some material to prevent the brick edges from chipping. Of the various materials used for this purpose a grout made of equal portions of Portland cement and sand mixed with water is recommended. Sand alone is sometimes used because of its cheapness but it is open to several objections and its use in the end is probably not economical. Portland cement grout, on the other hand, binds the individual bricks together and converts the pavement into what is practically a monolith. Before the grout is applied the pavement should be swept clean and be kept moist by gentle sprinkling during the applications, of which there should be two. At the end of the second application the grout should completely fill the joints flush with the tops of the joints. The final step is to cover the completed pavements with a 1-inch layer of fine earth. This is done to protect the pavement from the weather and to keep it in a moist condition while the grout is hardening. The covering should remain on the surface for at least ten days and the pavement be closed to traffic during this period.

The objection frequently made to the grout-filled brick pavement—that it is extremely noisy—may be overcome by the proper use of longitudinal expansion cushions placed alongside of the curb. These expansion cushions are bituminous layers from ½ to 1¼ inches thick, varying with the width of the pavement.

In addition to the description of the various problems the new bulletin contains in an appendix complete typical specifications for the construction of a brick road.

Handed a Lemon.

From "Stung," Connecticut.—I heartily agree with your article entitled, "A Manufacturer's Mistake," and give you my experience with one of the kind which you are at liberty to publish, if worth the space. Early in October I purchased from a sub-agent in a nearby city a 1916 6-cylinder Model of a well advertised car. This car had seen 60 days' use as a demonstrator and was guaranteed to be in perfect condition and carried unlimited free service, under the hood on a plate was a nicely worded invitation to the purchaser to write the manufacturer, which I proceeded to do, asking for a price parts catalogue, a little information and stating that the car did not give half the gasoline mileage advertised, requesting them to inform me how to get the advertised mileage or give me the address of the best man in this State to tune up the car. The reply was the most evasive and unsatisfactory letter I ever received from a manufacturer. A dealer in green goods would have replied more openly. They did, however, say that a man would call on me, but he never called. The sub-agent tried his best to make the car run right, but without success. After two months of missing, stalling, disgust and cursing of the manufacturer, I disposed of the car for what it would fetch and went back to the Ford car. I have owned in eleven years eleven cars of eight different makes, cared for and repaired them myself and this was the worst lemon of them all.

Change In Ownership.

The Martin Rocking Fifth Wheel Co. has taken over the business of the patent rights of C. H. Martin, Springfield, Mass. The officers of the new corporation are C. H. Martin, president, Adolph A. Geisel, Treasurer, and H. G. Farr, Secretary. Mr. Geisel will have the general management of the business and he is a veteran in the automobile industry, having been connected with it for the past 15 years. The new company in addition to making fifth wheels, of different sizes, will make semi-trailers for the Ford size.

"Precision"

—in the manufacture of bearings is what determines their worth as component parts of any motor car.

NEW DEPARTURE BALL BEARINGS

American Made for American Trade

by reason of their precision, plus the quality of material from which they are made, have become the choice of eighty-two per cent. of American car builders—the reliance of thousands of car owners.

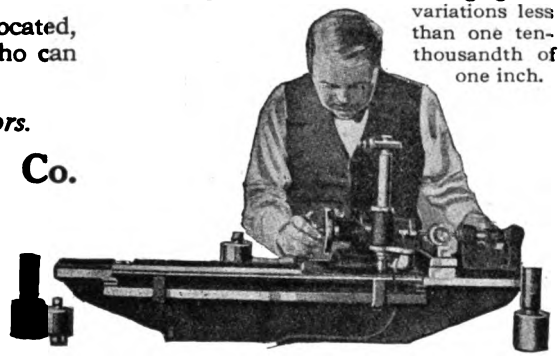
For like reasons and because New Departures can be used in replacement of the same type of ball bearings of any manufacture,

Many Dealers and Garagemen

use them in their repair work. Wherever you may be located, there is a New Departure service distributor nearby who can supply you without delay.

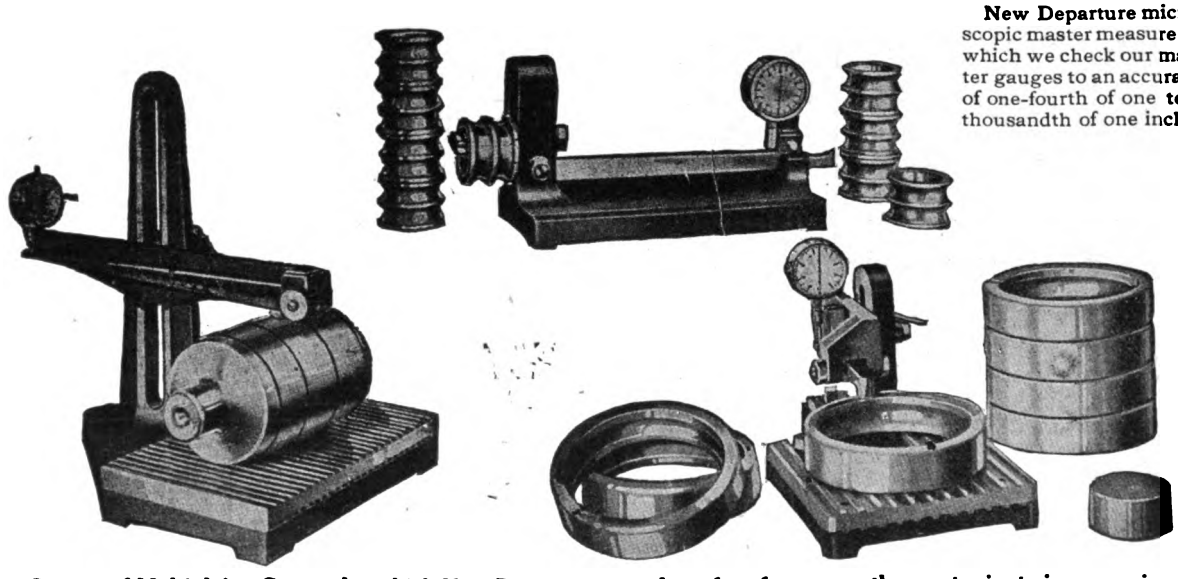
Send for our Garage Manual and list of Distributors.

The New Departure Manufacturing Co.
BRISTOL, CONN., U. S. A.



Conrad Patent Licensee

WESTERN BRANCH: 1016-17 Ford Building, Detroit.



Distributors in Trade Centers throughout the United States.

Sole British Agents: Brown Bros., Ltd., London and Manchester.
For Continent of Europe:
Jacob Holst, Copenhagen, Freeport, Denmark.

How New Departure finished balls are measured insuring against variations less than one ten-thousandth of one inch.

New Departure microscopic master measure by which we check our master gauges to an accuracy of one-fourth of one ten-thousandth of one inch.

Groups of Multiplying Gauges by which New Departures are kept free from even the most minute inaccuracies.

Tires Guaranteed

Our Double Tread Tires are vulcanized together instead of stitched or riveted together. There are no stitches or rivets to cut your inner tubes. They are practically blowout and puncture-proof. Let us send one to you to-day for trial. Money back if not satisfactory. Our new catalogue will describe to you the advantages of our Double Tread Tires.

These tires average about 5,000 miles.

Piston Rings

Preserve Your Power
Davidson Multiple Piston Rings will do that and more.

They will create

LESS FRICTION	MORE COMPRESSION
LESS HEAT	MORE POWER
LESS WEAR	MORE MILEAGE

The motor will not smoke and you save gas and oil.

The **Davidson Multiple Piston Ring** is a flexible two-piece concentric ring with equal expansion at all points in the firing chamber. Fits ring slot tight. Makes it impossible for gas, oil or carbon to fill slot or clog concentric ring.

Write for literature.

An Aluminite Piston.

An aluminum piston new in design and material employed has been brought out by the Green Engineering Co., Dayton, Ohio. The piston, called Aluminite, is said to operate with less clearance than the ordinary aluminum piston, because of the reduction in expansion of the metal, kept comparatively cool because the heat is drawn away from the head and also is said to stand up well under extreme heat conditions. The piston is designed with conical head, the thickness of metal properly proportioned to conduct the heat from the hot center to prevent overheating, and giving maximum strength to the metal.

The Corbin Speedometer.

The Corbin-Screw Corp., New Britain, Conn., has made several improvements in the way of attaching its speedometer. A new bracket is being furnished which may be easily adjusted to four positions on either side of the dash, thus enabling the operator to arrange it conveniently to his line of vision. A new type of swivel gear is now made in one piece with the shaft to which the cable is attached, the gears being held in correct mesh by a collar. The gear section is filled with grease when assembled and needs no attention for a long time.

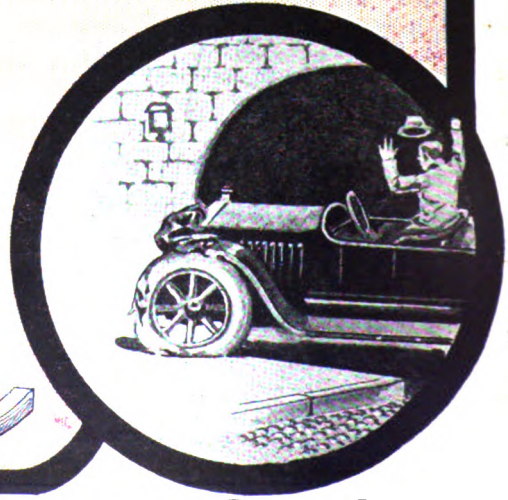
That Gemco Bumper Saved YOU ANOTHER REPAIR BILL

Gemco
MILWAUKEE
TRADE MARK
"THE MARK OF SATISFACTION"



THE easiest sellers are the things that save your customers money

—and Gemco Bumpers protect the costliest part of the motor car. The major part of all the bumpers made are Gemcos. We make them in all styles suitable for attaching to any car. Built overheavy for extra strength.

Get busy and sell Gemco Bumpers, Mr. Garageman. They are "safety first" equipment to every automobilist because the best driver you know does just this sort of thing every once in a while.

No matter where the blow strikes a Gemco, the end thrust feature absorbs the force at the strongest part of the car—the front end of the frame. Couple this up with careful workmanship and high grade material and you have got the key to "Gemco" superiority.

GET in touch with us at once and let us show you the big, sure profits to you in handling the complete Gemco line of bumpers and quick selling accessories.

Gemco Manufacturing Co.,

"Your Worn Tires!"

"What do you do with them?"

OR

Sell them to Jimmy the Junkman for 4¢ a pound

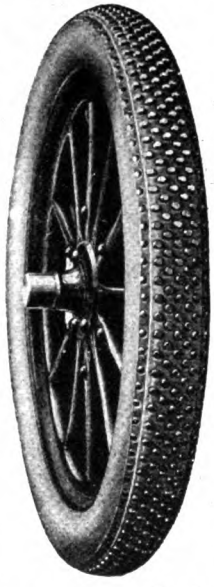
Get 5000 miles more service by putting on Steel Studded Treads

It's extravagant—and a **downright waste of good, cold cash**—to throw away your worn tires, or sell them to Jimmy the Junkman for a few cents a pound—because you can now get 5000 miles **MORE** service out of them by doing what European motorists have done for the past three years—and this will result in a ***SAVING*** of $50.00 to $200.00 a year to you.

European Motorists Get 10,000 to 15,000 Miles From Ordinary Tires

For the past three years European motorists have been getting from 10,000 to 15,000 miles out of a set of ordinary rubber tires, while American motorists have been satisfied with 1,000 to 3,000 miles—and what is even more important, European motorists have almost entirely eliminated the constant **dread** of punctures, blow-outs and rim cuts.

They do it by "half-soling" their tires with Steel Studded treads—and in the last eight months over 40,000 American motorists have followed their example and have "half-soled" their tires with Durable Steel Studded Treads.



Guaranteed 5,000 Miles Without Puncture

To many motorists this fact—**guaranteed 5,000 miles without puncture**—is of more interest than the money saved by eliminating tire repair bills. The constant dread of puncture or blow-out spoils the joy of motoring. Each unnecessary noise—each bit of broken glass or sharp edged stone—each bump or "pop"—makes the motorist think of tire trouble FIRST.

Durable Treads are backed by a signed guarantee—as good as a government bond—**for 5,000 miles without puncture**—many users get 10,000, 12,000 and 15,000 miles. Think of the joy you could have in motoring when you absolutely KNOW in your own mind that your tires are protected by Durable Treads and are **impervious to the roughest roads.** When you KNOW that **you** won't have to get out and sweat fixing a puncture—and the guarantee holds good whether your tires are new or old.

No More Skidding

"Durable Treads" are as sure footed as a Rocky Mountain burro—look at the photograph—see those steel studs—they're simply bound to be safe—the sharp edges will grip the slipperiest roads and make skidding almost an impossibility. With Durable Treads your tires are protected instead of injured, and you don't have to **climb out in the mud and slush to put on chains.**

Protect Your New Tires—Small Cuts May Ruin Them

Don't take chances with them—don't wait until they are cut up with sharp stones, glass, etc. Remember that a small cut usually develops into a sand blister—water soaks in and weakens the fabric—with the result that the tread of your tire comes loose from the fabric or else you have a blow-out. Either way it costs you **money, time and trouble.** Take a stitch in time and put on Durable Steel Studded Treads **immediately.**

We Deliver Free

Without a cent deposit—prepay the express—and allow YOU to be the judge. Remember that the new 1916 Improved Full Cover Durable Treads have **no springs or attachments.** They are gripped tightly by the rim, just the same as a tire—absolutely water and sand proof—and **easily applied in your own garage in thirty minutes** without special tools.

Special Discount

We offer a Special Introductory Discount to motorists in new territory where Durable Treads have not been introduced on the **first** shipment direct from the factory. The sales of Durable Treads (the PRACTICAL Tread) increased **917%** in the United States alone during the past year—over 40% of these sales were **unsolicited**—made through the recommendations of other Durable Tread users. Where is there another automobile accessory that has received such countrywide endorsement?

Mail The Coupon

Tear it off now—don't run your tires **another** week in a barefooted condition. Whether your tires are old or new you should protect them at *once*.

We have an interesting book of "10,000 Miles On One Set Of Tires," sample and guarantee ready to send you FREE—mail the coupon TODAY and find out how to get at least 5,000 miles more service out of your tires.

Junior size..... .50

NEW SIZES
TIRE-DOH, alone,
2 oz. can..... 50c
TIRE-DOH CEMENT, alone,
4 oz. can..... 25c

You Take No Chances

When you use the Original Tire-Doh. It does all we claim for it—and more.

Tire-Doh will repair the smallest inner tube punctures or blowouts and tears as long as your arm, because it has done so. It seals cuts and holes in casings so they will not develop into sand blisters—reseats torn-out valve stems and makes other difficult repairs. Don't fuss with cold patches or vulcanizing—Use Tire-Doh. Makes a quick, permanent repair without the use of tools or heat.

It's economical—two cents worth enough for the average puncture. It's easy to use—and it's permanent. But remember—get the original. *You must look for this trade mark.*

TIRE-DOH

Ten thousand dealers sell Tire-Doh, if yours doesn't, order direct from us.

Subjected To This Supreme Test

The New MASTER Calorite Spark Plug

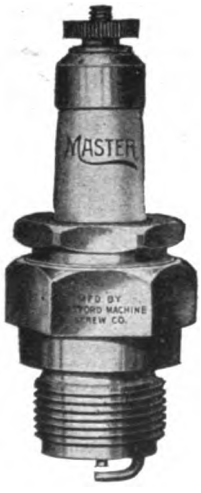
Heated Red Hot - 1500 Degrees Fahrenheit
Plunged into cold water 40 degrees, 26 times

Heated White Hot - 2000 Degrees Fahrenheit
Plunged into cold water 40 degrees, 10 times

An Extreme Change of Temperature of 1960 Degrees

These two extreme tests convinced us absolutely of the marvelous efficiency and ability of Calorite as an insulating material to stand any strains to which it might be subjected in Spark Plugs in the modern motor car. We have long realized the necessity of an improvement and advancement in Spark Plug Construction as evidenced by prevalence of spark plug trouble in last season's races. Our observations, tests, analyses, etc., served to establish the fact that the seat of the trouble mostly was in the insulators.

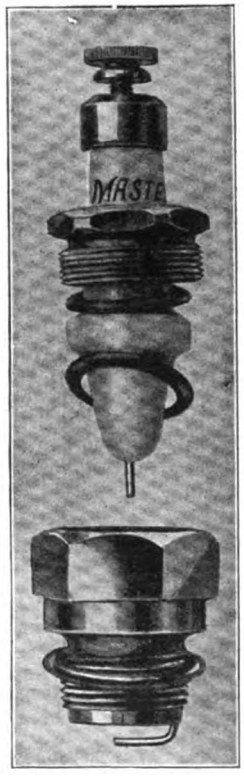
Our MASTER shell design—our MASTER electrodes and the metal used in MASTER Spark Plugs have proven themselves eminently satisfactory and scientifically correct—there was no necessity of even considering a change there.



Until Calorite, the new insulating material was discovered, our porcelain was the best material obtainable for spark plug insulators. But, with the discovery of Calorite, the old belief in porcelain was shattered. The merits of Calorite are so many and it is so superior to porcelain that to continue using porcelain for our insulators would not be doing justice to the other Master quality specifications—nor to our long established policy of manufacturing only the best.

Calorite Makes Masters the Leaders

We saw its wonderful advantages—
We realized that we had at last found a material which should make us the world's leaders in spark plug manufacture.
But we could not afford to take the slightest chance of making a mistake—and we didn't.
We had made a wonderful success with our Master porcelain plugs—
If we were to change, the new material must be able to stand any abuse—
And so after exhausting all ordinary methods of test we determined to subject Calorite to the most brutal and destructive strains imaginable.



The First Test

Heated until white hot, 2000 degrees, and then plunged into cold running water. This heating and cooling was repeated—ten times—the MASTER CALORITE SPARK PLUG alternately heated to this terrific temperature and plunged into icy cold water.
The internal stresses set up by this instant change from white heat to icy coldness were terrific—yet the CALORITE insulator was just as sound after being put through this radical test as before being subjected to these immense temperature changes.

The Second Test

To exhaust every means of possibly wrecking this material, our engineers attempted a breakdown test. This consisted of heating the MASTER CALORITE SPARK PLUG to a red heat, 1500 degrees and instantly plunging it into cold running water. This alternate heating and cooling was repeated 26 times. MASTER CALORITE SPARK PLUGS came through both of these tests unscathed.
The remarkable qualities of Calorite were all demonstrated after it had emerged from these terrific tests.
Then and only then did we decide to adopt Calorite as the one and only material suitable to make Master Spark Plugs the actual leaders.
Porcelain a few months ago seemed the finest, most practical material for spark plug insulators.
BUT—the finest samples of porcelain—subjected to a fair test along with Calorite did not meet in any way the requirements we sought.
We wanted to be fair—
We gave porcelain its chance—but it couldn't stand the gaff—
Some of the best samples of porcelain—subjected to the same tests as Calorite—heated white hot—broke the first heating—never even got to the cold water.
MASTER CALORITE PLUGS will not break in service—no matter how severe.
Won't soot.
Won't leak compression.
Won't give any trouble at all—we have tested them in every variety of service and we know.
In Calorite we have adopted a material for the insulators of Master Plugs which easily makes Masters the most dependable, longest lived spark plugs in the world.
This plug should prove the most remarkable seller that has ever been offered to the motorists of the country.
A guarantee which is most liberal and comprehensive goes with each plug.
Every Master Calorite is now packed in a round wooden box decorated with a label which in itself attracts the customer's eye.
The progressive dealer and jobber will reap the harvest which will come to those taking this plug on first.
Write for the story of Calorite and Master Plugs and for complete information on the advantages of handling these remarkable plugs.

JOBBERS and DEALERS—A new schedule of quantity prices go into effect January 1st. The Trade will be advised specifically ample time in advance.

SPECIALTIES

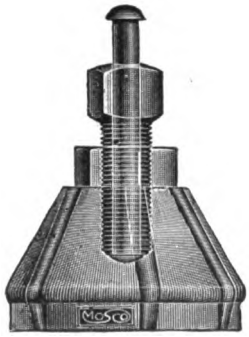
FOR 1916

TIMER SHAFT EXTENSION

Bemus Timer Patents { Sept. 24, 1907 / Dec. 17, 1907 / Feb. 16, 1915 / Apr. 27, 1915 } Others Pending

WHY were tens of thousand of these Timers sold in 1915? Why were we able to obtain a national distribution in a phenomenally short time? Why did 1,000 dealers from Boston to San Francisco look to us exclusively in 1915 for Timers for Ford Cars? **BECAUSE**

THE BEMUS BALL CONTACT TIMER



STOPS THAT SKIP. By reason of the method of mounting—on the time shaft—the main cause of skipping is eliminated. You will be surprised at the improvement here.

SMOOTHES OUT THE RUNNING to a degree which you would have believed impossible.

GIVES THE MOTOR MORE POWER, MORE SNAP, STEADIER PULLING, AND DOES AWAY WITH THAT JERKY RUNNING ON LOW THROTTLE.

PRICE $2.25

Reinforcement of advance arm by moulded-in steel bushing is a late feature.

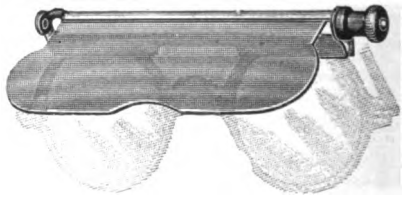
Patented { Mar. 24, 1913 / Dec. 15, 1914

WHEEL PULLERS

(Loose Plunger Type)

For Ford, Overland, Buick, Maxwell and Chevrolet Cars

Every practical man knows that the only way to start a wheel which is stuck or "frozen" to the axle is to drive back the axle while pulling the wheel. Two men are required by the old method—the ordinary wheel-puller will never take off a stuck wheel—one man can do it easily with the MOSCO puller. They have loose plungers extending through the screws—and bearing on the end of the axle. A blow with a hammer on the plunger, a turn of the screw, another drive with the hammer, and the wheel is off—no matter how long it has been on, nor how fast it is stuck. Information and prices on request.



MOSCO Valve Grinder

The working principle of this tool is entirely different from that of any other grinder, having an automatic reversing motion that eliminates all danger of rotating the valve too far in one direction. It is twice as quick as any other tool, and insures safety of valves even when grinding is done by inexperienced persons. The superior finish which is produced is a delight to every user. Now furnished with two forged tools—one for Ford valves and a standard universal tool for other engines. This is one of the best specialties we have ever made. Should be in every tool kit.

PRICE $1.50 EACH

MOSCO Adjustable Eye Shade

Fits All Goggles and Eye Glasses

Readily Applied by the User

LIGHT — COMFORTABLE — CONVENIENT — SAFE

The first and only real solution of sun glare and night driving problems.

This attachment provides a convenient and inexpensive means for protecting the eyes from any blinding glare from any source, especially from automobile headlights by night and from sun rays by day. It is in the nature of a visor, but is adjustable to any angle to meet rays of varying heights. The shield is made of transparent material which subdues blinding lights without obstructing the view.

THE BUELL EXPLOSION WHISTLE

Write for Circular

Agents Desired

A New Type of Signal

operated directly by the explosion thru the priming cup opening in the cylinder.

Not an Exhaust Horn

Extreme simplicity assures freedom from all trouble. Consists of a poppet valve and a 5 oz. whistle. First cost low. No operating expense. Very easily installed.

Far more effective than an exhaust horn as the gas operating has at least ten times the pressure. Uses but a portion of the charge, the equivalent of opening a pet cock for an explosion or two. When you hear that powerful, distinctive note, you will know it is a Buell.

Sold on Trial
Guaranteed for Life

Oxy-Acetylene Welding and Cutting

Welding together pressed steel halves of rear axle housing; making one-piece construction.

This Modern, Profitable Method Deserves a Place In Your Shop

Every day you delay putting yourself in position to utilize Oxy-Acetylene welding economies in motor car manufacturing or repairing, you lose good legitimate profits.

Progressive automobile manufacturers are securing better features in design, such as reduction of weight, and increased strength, at less cost, than is possible by any other method of construction. Subsequent finishing of welded parts is easy, when required, since the metal is left in perfect workable condition.

The Logical Repair Method

For the same reasons that oxy-acetylene welding has proven itself tremendously valuable for manufacturing operations, the process offers the logical method for metal repairs. It supplies the best and cheapest method of joining broken or worn metal parts, giving increased quality at less cost.

In addition to regular automobile repairs, the live garageman can "cash in" on many welding repairs outside the automobile field. For this there is a large established demand.

At very moderate charges for work done, the profits thus gained mean a materially increased income. INVESTIGATE.

Prest-O-Lite PROCESS

Employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene (ready-made carbide gas) is backed by Prest-O-Lite Service, which provides dry, purified gas, insuring better welds, quicker work, and lower cost, and also avoids the large initial outlay and heavy depreciation incurred in making crude acetylene in a carbide generator.

The necessary equipment is not expensive. We furnish high-grade welding apparatus for $60 (Canada, $75); acetylene service at additional cost. Also adaptable for oxy-acetylene cutting by the purchase of a special cutting blow-pipe. Thorough instructions are furnished free to every user—any average workman can learn the process quickly. We will train your operators at our shop if you desire.

Enterprising Men Find This a Good Business Opportunity

Welding profits are sure and come quickly because of the growing demand for oxy-acetylene welding. Get your share now.

Free illustrated literature showing how you can secure oxy-acetylene welding profits in your shop, sent on request.

When Gasoline is High— Look to Your Lubricants!

The average car owner would save ten per cent on his gasoline bills, if he could coax another mile or two out of each gallon.

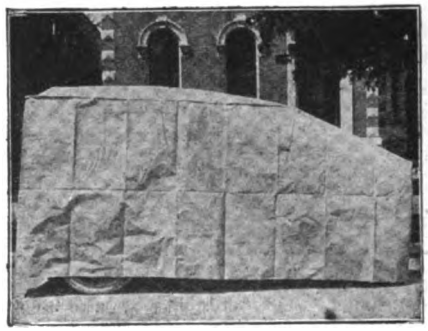
Friction is the greatest foe of fuel economp.

It eats up power in bearings and gears; it eats up bearings and gears too.

Efficient lubrication will do much to offset the depredations of friction.

Tests made by leading auto manufacturers have proved NON-FLUID OIL to be the highest grade and most efficient automobile lubricant produced.

You too would readily recognize the advantages of NON-FLUID OIL over common greases.



Get a can from your dealer today and try it, or write for free sample.

NON-FLUID OIL is packed only in orange-colored cans.

New York & New Jersey Lubricant Co.
165 Broadway New York

KENNEDY AUTO STORAGE COVERS

To meet the need of an inexpensive and efficient cover for automobiles while in dead storage we are making a paper cover, which is proving the right thing for this purpose.

These covers are made of strong heavy paper, properly reinforced to prevent tearing.

They protect the car against dirt, dust and moisture and will prevent the polished portions from tarnishing and the finish from checking in cold weather.

These covers are salable to individual car owners at a good profit as well as to furnish the dealer a protection for his stock of new cars.

We make them in four sizes: 7 PASSENGER, 5 PASSENGER, FORD SPECIAL, ELECTRIC.

Winter will soon be here and dealers can handle these covers with satisfaction and profit. Further information on request.

ENDURA Sheet Packing

BETTER :-: LIGHTER Lower in Cost

Three of the most important reasons why you should buy a RAPID-FIRE Storage Battery for your car.

A 6 volt self starter requires an output of 100 amperes or upwards to turn the engine over.

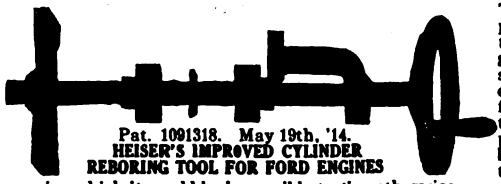
Our battery will discharge 100 amperes two to four times as long as other batteries of like weight and size.

We will remake your old battery with new plates throughout and prove our assertion.

If you do not feel like buying a new battery let us remake your old one. We will guarantee you one full year of service.

Nearly all the trouble in storage batteries is caused by the plates buckling.

We guarantee our plates not to buckle. Remaking in this way gives you practically a new battery at about half the cost of a new one.



Ask for our Price List for Remaking.

The Wright Rapid-Fire Storage Battery Co.

96 MARKET STREET **Tiffany Building** **POUGHKEEPSIE, N. Y.**

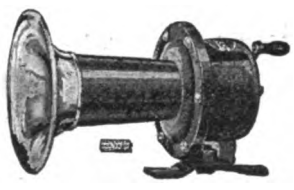
REPAIRMEN!

MAKE MONEY REBORING CYLINDERS

Pat. 1091318. May 19th, '14.
HEISER'S IMPROVED CYLINDER REBORING TOOL FOR FORD ENGINES

This tool accomplishes results the same as grinders costing several hundred dollars and a few jobs enables the machine to pay for itself, besides giving the customer service which it would be impossible to give otherwise.

It requires an expenditure of $5.00 and 90 minutes energy to make the cylinders and pistons as tight, true and new as the day they left the Ford Factory. Reboring and fitting oversize pistons is the most important repair that can be given a worn motor, and this is the most important tool you can buy for your shop, for the low price of the tool together with the low price of the pistons makes it an attractive proposition for the repairman who wants to make his shop popular.



Do it now: The first job of reboring means $ $ $ $ $ to you, if it is done in your shop.

Write for Full Particulars and Proposition

We furnish the oversize pistons, $1.25 each, net.

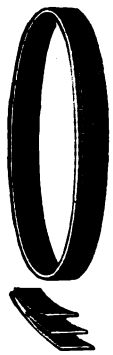
G-E Form K Mercury Arc Rectifier

Simplicity

All that is needed for charging your starting battery at home is a G-E Form K Rectifier and a hydrometer.

Simply connect the Rectifier to lamp socket and battery.
Simply rock the Rectifier once or twice to start it.
Simply leave charging until specific gravity on hydrometer stops rising.
Simply disconnect.

Isn't it simple to keep batteries fully charged—and isn't it a mighty big satisfaction to be assured of positive starting even in zero weather?



You can have a power plant for your batteries right in your own home at a very small expense and trifling operating cost.

If your dealer does not stock the G-E Form K Mercury Arc Rectifier, write our nearest representative.

THE NEW TWIN SPRING SHOCK ABSORBER

FOR THE FORD
DODGE
OVERLAND
MAXWELL
and All Cars

PLAIN SPRING TALK
In the Spring by Spring People

We are asked every day to explain wherein the **Twin Spring** differs from the **Shock Absorber** in general use today. The great majorty of **Shock Absorbers** are nothing more or less than a *brake* applied on the *leaf springs*, which retards their action and prevents them from doing the work for which they were intended. They *reduce* the spring capacity of your car instead of *increasing* it. There are other **Shock Absorbers** of the *cylinder* or *plunger* type made on the principle of the *door check.* They absorb the first shock but are slow to recover for the next; while your car is waiting for that recovery you are riding practically without springs of any description.

The **Twin Spring** is a *supplementary spring,* instantaneous in its action. The principle and result obtained therefrom is entirely foreign to the so-called **Shock Absorber. Twin Springs** are *free to act* in every way in conjunction with the *leaf spring.* They not only leave the *leaf springs* free to perform the work for which they were designed, but they assist them to perform that work. **We challenge contradiction to our claims.** Get an expert's opinion. Every road shock coming from the wheel passes through the **Twin Spring** (see those coils) on its way to the body of your car. The *shock* is transformed and reduced, the *life* is taken out of that *shock* right there, and that without in any way disturbing the action of the *leaf springs.* Call them **Shock Reducers** or **Shock Transformers,** anything you like, they are the only **Result Producers. Let us prove to you, Mr. Car-Owner,** that **our statements are correct.**

Write for our agents' proposition and prices.

Trade **"NO-LEAK-O"** Mark

A Scientific Oil Packing Piston Ring
A Ring With A Reason

There's no mystery about "NO-LEAK-O" Rings. A simple, plain mechanical fact.

Piston movement, uneven expansion and contraction makes perfect fitting impossible. It's the OIL that forms the seal, prevents escape of gas and lubricates.

Mr. M. J. Brandon, Mechanical Engineer of the Avery Co., Peoria, Ill., writes: "They cut the consumption of lubricating oil in two; a great saving in gasoline; spark plugs are clean and about 10% more power can be gotten out of the motor."

The grooves convey enough OIL to form the seal, which means perfect compression without WASTE; maximum power with less GASOLINE; perfect lubrication without CARBON, smoke and oily plugs.

We absolutely GUARANTEE each ring for QUALITY, ACCURACY, and satisfactory service.

ONE PIECE LOW COST HIGH EFFICIENCY
Carbon Eliminated by Controlling the Oil.

Westinghouse Starting-Lighting-Ignition
For Ford Cars

The new Westinghouse equipment for Ford Cars is now ready. It has been thoroughly tested on Ford Cars in all conditions, and over all sorts of roads, and has demonstrated its thorough reliability.

The Starting and Lighting unit is mounted on adjustable brackets, and is driven by a Westinghouse compensating sprocket through a special silent chain three tons strong. Everything necessary for the equipment comes with it—switches, armored wires, storage battery, pressed steel battery box, and all details. Deliveries can be made immediately.

FOR EVERY FORD OWNER, DEALER, SALESMAN and REPAIRMAN

THE MODEL T FORD CAR
ITS CONSTRUCTION, OPERATION AND REPAIR

By VICTOR W. PAGÉ

Member of the Society of Automobile Engineers.
Author of "The Modern Gasoline Automobile," etc.

300 (5x7) Pages
Over 100 Specially Made Engravings
AND TWO LARGE FOLDING PLATES

Price $1.00

This is the MOST COMPLETE and PRACTICAL instruction book ever published on the FORD CAR. Illustrated by specially made drawings and photographs. All parts of the Ford Model T Car are described and illustrated, in a comprehensive manner—nothing is left for the reader to guess at. The construction is fully treated and OPERATING PRINCIPLES MADE CLEAR TO EVERYONE. Complete instructions for *driving* and *repairing* are given. Every detail is treated in a non-technical yet thorough manner.

FOR "LEAKY CYLINDERS"

PISTON RINGS

LESS CARBON-MORE POWER

EVER TIGHT PISTON RINGS have perfect elasticity from three points, meaning an even distribution of pressure all around, and a decrease in friction. You do not have to rebore cylinders.

A FEW "EVER TIGHT" FACTS

EVER TIGHT PISTON RINGS produce perfect compression
EVER TIGHT PISTON RINGS produce more power
EVER TIGHT PISTON RINGS decrease maintenance cost
EVER TIGHT PISTON RINGS eliminate carbon troubles

The Ever-Tight Piston Ring Co., St. Louis, Mo. Indianapolis, Ind., July 8, 1915.

Gentlemen—

With reference to my recent trip from San Diego to New York in a Stutz Bearcat, in eleven days, seven hours and fifteen minutes, I owe much of my success to the EVER TIGHT PISTON RINGS, inasmuch as the car did not lack a bit of power, the way it pulled through the sand and took the hills and mountains was certainly remarkable, the EVER TIGHT PISTON RINGS truly deserve full credit for their reliability.

Yours very truly,
E. G. BAKER

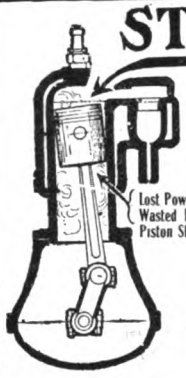
INLAND
1 PIECE PISTON RING

A guaranteed, gas-tight ring in *one* piece—at a *lower* price.



A continuous ring, cut spirally for half its circumference; heat treated so that the free ends hug tightly together. The result is a ring that uncoils in expanding, insuring uniform gas-tight pressure and continually perfect contact with the cylinder walls.

The strongest, gas-tight ring made, because it is one piece and of uniform width and thickness; no weak or thin places. Costs less to buy and less to install; easier to put on and will not break in handling. Made of close grain cast iron. Absolutely guaranteed; money refunded on any ring that fails to give perfect satisfaction after 90 days' trial.

Full description in free booklet.
Dealers and jobbers should write for interesting prices.

INLAND MACHINE WORKS
802 MOUND STREET, ST. LOUIS, MO., U. S. A.

STOP THE KNOCK

WASTED FUEL
LOST ENERGY
PISTON SLAP

When your motor is worn or cylinders scored the explosive pressure will escape down between the sides of the piston and cylinder walls and the fuel used to produce this energy is lost. This condition of your motor causes a waste of fuel, which necessarily increases the cost of operation and causes that misery of nerve-racking noise.

With your cylinders reground and new pistons and rings fitted, your motor will run like new, will have more power, smoother and quieter running. Where the cylinders are scored, we puddle in molten iron and thus retain the original strength of the cylinder walls.

We specialize in this work and have the most modern and complete equipment in the country. This work is done by skilled engine mechanics. Satisfaction is absolutely assured.

AUTO MACHINE WORK, wrist-pins, gears, crank shafts, bushings and valves.

Don't delay—ship your cylinders, or write us.

THE MOTOR ENGINEERING COMPANY
Automobile Engineers, Machinists and Designers
1688 West 3d Street CLEVELAND, OHIO

An Automobile Necessity

That should be in every auto kit and will save you many a dollar at garage and repair shops. It will also do away with the carrying of extra wheel or shoe attached to the car.

That Means The End Of Tire Troubles

as it will enable you to fix instantly, while on the road, or in your garage, any puncture or blow-out, from a pin-head to an ugly gash,

Without A Change Of Wheel Or Tire

or taking the auto to a garage for repairs, that make you dig down deep in your pockets.

The Worcester Automatic Vulcanizer

"Worcester Made"

requires no experience to operate. Every machine is guaranteed, adjusting all tire troubles in the shortest possible time, avoiding all road delays, making permanent repairs in Tube or Shoe, that are lasting, cost little, safe, speedy and strong.

Chas. E. Miller

Anderson Rubber Works

Established 1894

Anderson, Ind., U.S.A.

How to Become an Expert Automobile Mechanician

The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical simplified instruction on everything you OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine; from the construction of different type axles to the sleeve and rotary valve type of engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. For instance, under the subject of storage batteries you learn how to test a storage battery with a hydrometer instead of a pair of pliers.

Step by step you advance until you are a real expert on timing the valves and ignition. You learn the carburetion subject so thoroughly, you can adjust any make.

Delco, Ward Leonard, Entz, Westinghouse and all electric starting systems will be clear in your mind.

It is chucked full of just the things you OUGHT to know and want to know. There are over one thousand seven hundred and fifty illustrations—simplified illustrations, which, in most instances, explain without the use of the text.

As stated above, the illustrations are SIMPLIFIED; take for instance the illustration of the Atwater-Kent Ignition System, the illustrations show in detail all the INSIDE parts, and just how the coil is wound, how the depolarizing switch operates and why it is necessary—in other words, all detail usually omitted by others is included.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

THE GIBSON SWITCH CONTROL

most important control feature brought out in years; a necessity for Ford cars; welcomed alike by expert and beginner; bridges the gap between the driver and his motor, and enables him, by a touch of the finger, to throw switch to any position instantly without removing hand from wheel or eyes from road; saves its cost in brake linings and gasoline in short time. Weighs 14 ounces; inconspicuous and entirely out of way.

For sale by dealers, or delivered by parcel post anywhere in the U. S. for $2.00.

Money back if not satisfied. Liberal discount to the trade.

Full particulars mailed free.

Tire Life Insurance—

{Increased Mileage—Fewer Blowouts
Fewer Punctures—Fewer Repairs}

result from using a

Curtis Air Compressor and Curtis Correct Pressure Tire Filling Station

Style "Z"

Style "X"

Because they furnish AIR FREE FROM OIL and at correct pressure for each size tire.

Does this mean anything to you, Mr. Garageman, Mr. Dealer? It should mean better service to your patrons; service that will bring its own reward in increased sales, increased profits.

The customer simply turns the dial to the size of his tire to get correct pressure, without fear of over or under inflating, without having to borrow a tire tester or using your help, and the air that you furnish them will be AIR FREE FROM OIL.

It interests them when you explain it, it touches their pocket when you show the saving it means to them, and your giving this service free—Say, but it is a drawing card all right.

Check the style outfit you would prefer, clip out and mail this ad. to us and we will send you complete information including prices.

5405 Easton Avenue - - St. Louis, Missouri

"There's a mighty big difference in lubricators!"

Don't blame your car for what it can't help. Many a car is inefficient only because its lubrication is bad. Try Badger Gear Compound **just once** and notice the difference.

BADGER Gear Compound

Is "Always on the Teeth"

It never runs thin and stays where you put it. Will not pack the sides of the gear case. Nothing like it for minimizing wear and quieting rear axles and transmissions. **Every ounce lubricates.** Learn more about this power-saving lubricant—also about the popular F. V. Motor Oil and Badger Lubricants. Ask your dealer or write us. *Dealers, write us*

WADHAMS OIL COMPANY, Milwaukee, Wis.

Coast Distributors: Wadhams Oil Company of Washington, Seattle, Wash., and Vancouver.

THE STALIT HEATING PLUG

Eliminates all trouble in starting a motor in cold weather. No priming of the cylinders or tickling the carburetors necessary.

SIMPLY TURN ON THE SWITCH

a minute before starting, after the Stalit Plug has been attached to the inlet manifold.

THE AIR IN THE PIPE IS HEATED, AND THE RESULT IS MIRACULOUS

Also indispensable when used in conjunction with the electric starter, as it will save the intense strain due to continuously turning over the cold motor.

YOU GIVE THE ENGINE ONE YANK AND OFF SHE GOES

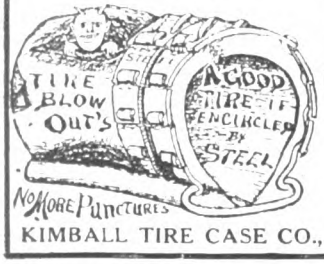
STANDARD FORD 1915 EQUIPMENT

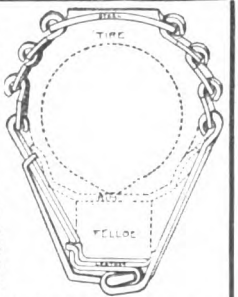
"Absolutely Accurate"

Special for Ford Cars



Mounted flush in a bracket on the cowl. A remarkable opportunity for dealers. Write or telegraph for details,

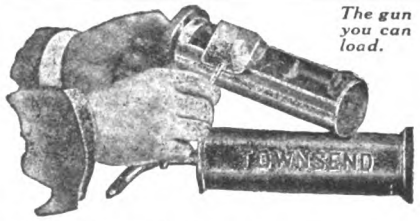
Sears-Cross Company



Bush Terminal **Brooklyn, New York**

Hang on to your old tires. They will last as long as you live if covered with steel. The Kimball Steel Protector makes Blowouts, Punctures and Rim Cuts impossible. A few sections will hold any old blowout. Tires as flexible as ever.

Special inducements to those in new territory.

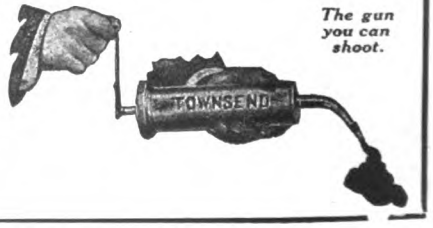


MUD CHAIN can be put on in a jiffy with one hand while standing on the run board. If you get in a mud hole you will laugh out loud. Hook the ends together and pull the little lever and they are on tight. Good for blowouts.

KIMBALL TIRE CASE CO., 174 Broadway, Council Bluffs, Iowa

The gun you can load.

It can be filled— *others cannot.*



It is clean— *others are dirty.*

Easy of Operation— *others difficult*

Fill with a steel paddle, sent with the gun, slip one tube into the other, secure with cap and turn the handle. You can load and shoot a pound in a minute. Not a particle of grease gets on your hands or clothing.

6 Oz., $3.00 8 Oz., $3.50
12 Oz., $4.00 16 Oz., $5.00

The NISWANDER TIRE RIM REMOVER

If you have ever had occasion to repair the tires in your auto, you will appreciate the merit of our demountable rim remover. They fit any rim, regardless of make or size, are small and compact, yet strong and substantial, and are so simple that there is nothing to get out of order about them. Fig. 1 shows the device contracting the rim. Fig. 2, expanding the rim and forcing it back into place in the tire. Fig. 3 shows the device folded to a length of Ten inches, and as the weight is but 2½ pounds, it is a great device requiring very little space. They have a polished nickel finish and therefore will not rust. This device can be purchased from any dealer for the sum of $3.00, but if your dealer does not have them, we will on receipt of the above price, send you one by prepaid parcel post.

DO YOU WANT A MOTOR CLOCK

For your car, and a good one? The clock illustrated in this connection is manufactured by one of the most reliable clock companies in the country and is warranted in every respect. It is not liable to get out of order. It has interchangeable parts. It is the product of skilled labor combined with the most improved Waltham Automatic Machines. This clock is 3⅜ inches high, and 2½ inches in diameter. It has a one day movement with second hand. It can be furnished in burnished brass or nickel plated whichever is preferred. The arrangement we have made enables us to furnish **one of these clocks and a subscription to the Automobile Dealer and Repairer for a year** to all residents of the United States and its territories for the precise price the clock retails for, namely, **$2.50.** If an eight day clock is preferred send 50 cents extra or **$3.00.** Canadian subscribers should add 50 cents extra to cover the extra postage required on the **Automobile Dealer and Repairer.** This clock cannot be sent to foreign countries. The clock can safely be sent by mail and will be forwarded postage prepaid to any part of the country. Remittances can be made in any convenient way. Address

MOTOR VEHICLE PUBLISHING CO.
71-73 Murray Street, - - - - - - New York, N. Y.

Every Repair Shop or Garage
SHOULD HAVE A CLOCK.

We have recently made very favorable arrangements with one of the largest clock companies in this country by which we are enabled to offer to our readers in the United States or its territories a **Regulator Eight Day Calendar Clock** 38½ inches high, with a 12 inch dial, finished in **Oak** or **hand-rubbed Mahogany,** with a subscription to the **Automobile Dealer and Repairer** for one year, at the very low rate of **$3.90.** This clock cannot be sent to any foreign country except Canada, and Canadian subscribers must send **50 cents** more to cover extra postage on the paper.

Every repair shop, garage or dealer's office should have one of these clocks. It will give you the time of day correctly and the day of the month.

The engraving shown gives the correct appearance of this clock.

This offer is good for either old or new subscribers.

Remittances can be made in any convenient way. Be sure to state whether you want this clock in Oak or Hand-Rubbed Mahogany.

Pressure Proof Piston Rings

stop oil troubles because they take up side wear in piston grooves by means of the spring expander acting on the bevel on the under side of the ring. This feature appears in no other piston ring.

They are made of soft cast iron, no steel or composition to score cylinders.

Ever see a piston ring that would give perfect service after being broken?

(Section of Ring)

The Pressure Proof is the only ring that will do this. Let us tell you how.

The Pressure Proof Ring will give longer service and higher efficiency than any other ring made, regardless of price or construction.

See us at the Boston Show, Space 449.

Dethrone King Carbon

In too many motors carbon is king. It chokes them up, impairs efficiency, reduces power, fouls spark plugs and grinds away at the very vitals of the mechanism. You can prevent his and serve the interests of your customers best by installing

BURD RINGS

The Metallic Guard closes the opening and prevents surplus oil working up into the combustion chamber, there to be burned and formed into carbon. Carbon shortens the life of thousands of cars—sends them to the junk pile long before the have outlived their usefulness.

The fact that Packard, Haynes, Saxon and other well known cars are factory equipped with Burd Rings is mighty good evidence of their efficiency. Interesting information on request.

Burd High Compression Ring Co., Rockford, Illinois

Digitized by Google

Acid oils destroy the fit of bearings, valves and rings. Many oils contain acid matter which decomposes at high temperature and attacks the motor parts. The Heat and Emulsion Tests, which are described in the Veedol Book, tell the whole story. Veedol oils run the gauntlet of these searching tests and show the total absence of acid products.

Carbon deposits in the explosion chamber, due to their low head conduction, become white hot when the motor runs. That is why carbon ignites the compressed gases at the worst possible time—before the piston has reached the proper position in the upward stroke. This causes vicious, racking blows—"knocks" upon the bearings, rapid wear and a great loss of power. Therefore—avoid inferior oils which rapidly carbonize the cylinders of your motor. Veedol will save you this unnecessary and costly annoyance.

Write for the Veedol Book on Automobile Lubrication, sent free upon request. The carbon and acid tests and many other subjects of interest to the motorist are discussed fully therein.

DEALERS!

Your money should not be tied up this season in any oil, until you have talked with the Veedol salesman and seen the Veedol Dealer's advertising campaign. (It costs the dealer absolutely nothing.)

Your new oil customers will be created by strong local advertising over your firm name. Once they buy Veedol from you, Veedol quality will prove superior, and your sales will be permanent.

Advertising your company name in connection with these quality oils will bring the sales right into your hands. The advertising will, in this way, make new customers for your other accessories.

Before you buy any more oil, see the Veedol salesman. Write today for our special portfolio describing the advertising campaign that we would run over your name, and a copy of the 44-page Veedol book.

Benford's Monarch Indestructible Ammeter

A little carelessness in handling it and down goes the Ammeter on the floor with a bang. **It is ruined!**

Then you wish for an Ammeter that can be thrown a mile, and be able to test your dry cell when you pick it up.

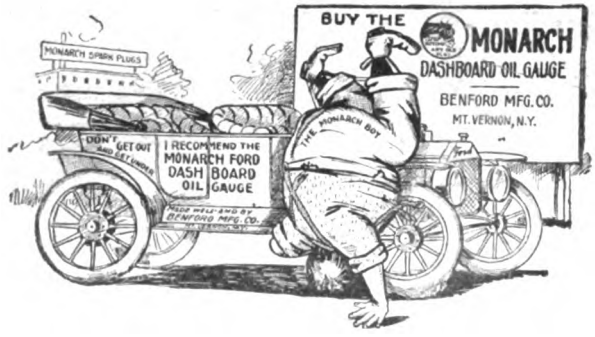
Here at last is one that can stand hard knocks, bangs and kicks without wincing. Give it all the abuse you can. It won't stop working. When you get ready to test, it registers the correct amperage of a dry cell up to 30 amperes.

Suppose you slip a $1.00 in an envelope while you are thinking about it and get one of these little wonder workers.

Price $1.00

Monarch Spark Plugs

Dealers, your customers are tired of cheap Spark Plugs. They don't want worthless goods sold under cover of well advertised names.

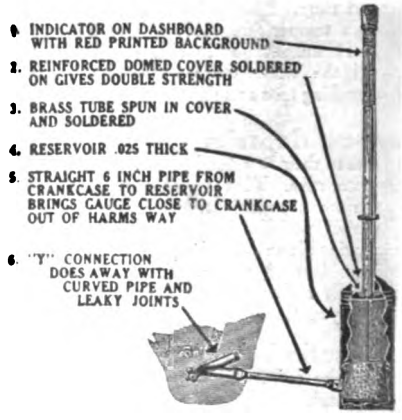


Why not give them Spark Plugs that you won't be ashamed of? Make every buyer so well pleased with the plugs you sell him that he will come back to you again and again.

Sell Monarchs for quality's sake.

Guaranteed for the life of your car.

75c. Each



Monarch Dashboard Ford Oil Gauge

Before your Ford car leaves the garage, down you go on hands and knees to see if there is oil in the crank case. You go through that dirty job of searching for the pet cock, probably wishing for some wise head to show you how to find the oil level another way.

Use the **Monarch Dashboard Ford Oil Gauge** and tell how much oil you have right at the dashboard. The instrument is before your eyes as you sit in the driver's seat. You can't miss it. The oil will never run low without your knowing it. For convenience there is nothing like it. For safety, it is unequalled.

Non-Skid **Wrapped Tread**

Mattson Unguaranteed Tires

Experienced Motorists in ever increasing numbers are turning toward

MATTSON
Unguaranteed Tires

They have discovered that they average better value—service and cost considered—than other kinds.

Nobody knows the life of a tire because nobody can foresee the conditions under which they will be used.

Under favorable conditions a tire will last longer—*guaranteed or unguaranteed*—than under unfavorable conditions.

MATTSON Unguaranteed Tire prices have decided thousands of motorists to try them. The Results MATTSON Tires give invariably decide them to keep on using them.

With increased and improved facilities—made necessary by the growing demand—we are entering upon our ninth year in the manufacture of unguaranteed tires.

While we sell only at wholesale we will be glad to tell you where you can get Unguaranteed Tires.

This information will be valuable, for you can save considerable in your tire expense by using MATTSON Unguaranteed Tires—Plain Wrapped or Non-Skid Treads.

Ask your dealer about the other famous MATTSON Rubber Accessories.

Saves Washing Car

S. C. JOHNSON & SON, Racine, Wis.

Gentlemen: In answer to your letter of the 24th, I had a hard time to get my boss to try the Wax on a new car he has to demonstrate with, but landed him and now he will not use anything else. He thinks it is great. It has saved me washing the car every day. Once a week or once in two weeks will keep the car looking like new. I take great pains in showing it up. It is great stuff believe me.

Yours very truly,
K. PAUL,
Schenectady, N. Y
25 Elm St.,

Thought Car Was Repainted

S. C. JOHNSON & SON, Racine, Wis.

Dear Sirs: I must tell you a little experience I had the other day. An auto came in to be washed: it was so covered with mud you could not see the auto. I washed it and polished it with Johnson's Wax; the man came back after driving around the city, said everyone thought his car had been repainted.

Yours truly,
A. H. BRILL,
Hastings, Mich.

What Kept Car So Nice?

S. C. JOHNSON & SON, Racine, Wisconsin.

Gentlemen: We used the Wax on the auto and had several inquiries regarding the shine.

One man, a stranger, called up by phone, asking what we used to keep the car looking so nice. He is now a user of Johnson's Wax also.

Yours truly,
E. F. LINGQUIST,
Logansport, Ind.

What Motorists say about JOHNSON'S PREPARED WAX

Leaves Hard, Dry Surface

S. C. JOHNSON & SON, Racine, Wisconsin.

Gentlemen: I have never used anything that anywhere near equals Johnson's Prepared Wax for giving a high gloss that will turn rain and dust.

All polishes that I have ever used before leave such an oily surface that the body will collect more dust after using it than before, but your Wax leaves such a hard, dry, as well as glossy surface that dirt does not stick to it, and for the first time I can now polish my car without getting my hands all over grease and oil and mussing things up generally.

Yours very truly,
Chicago, Ill. B. F. SAWIN,

—is that it is a dust-proof, water-proof, mud-proof and sun-proof polish for motor cars, which gives a hard, dry, glossy finish that **lasts.** Users say JOHNSON'S Prepared Wax is **unequalled.** Judge for yourself. Send for sample can.

S. C. JOHNSON & SON
RACINE Dept. AD WISCONSIN

Makes Car Easy to Clean

Gentlemen: Upon the arrival of your sample can I had the Wax applied to my car in light coats. Each coat was allowed to dry well and then well rubbed before the application of the next. After the third coat the varnish seemed to me to have acquired a gloss of greater depth and the car looked as well as when new. After a few rain storms I had the car washed clean of the mud acquired and was more than pleased to find the car still bright without the application of another coat of Wax. An occasional coat of wax has kept the car looking well and easy to clean during our rainy and muddy winter.

Very truly yours,
ERNEST O. BILLWILLER,
Stockton, Calif.

A Hard Polish—That Collects No Dust

S. C. JOHNSON & SON, Racine, Wis.

Gentlemen: I find that Johnson's Prepared Wax is a very fine preparation to use on automobile bodies. The wax does not collect dust like most body polish. I find that it retains its hardness under this southern sun. The car I used this polish on had lost its original gloss. After applying one coat of the Wax the finish looked like new. Johnson's Prepared Wax is the best polish that I know of for auto bodies. I remain

Yours truly,
JOHN BARON, JR.,
El Centro, Calif.

Send us 10c for a can of Johnson's Prepared Wax—sufficient for one application on a large car.

Mr. Garageman: Mr. Repairman:

$ LOOK HERE $

You need a WATERHOUSE Welding Outfit, for with it you can save broken auto parts and make them as good as new at very little cost.

To illustrate, a repairman, with this outfit, repaired a broken crank-case, which in its damaged condition was only worth 14 cents per pound as old junk. After welding it was made precisely as good as a new part, which would cost $68.

Here the repairman saved the car owner lots of money, and by so doing the car owner was willing to pay the repairman a big price for his welding, which meant big profits.

PACKED

The Waterhouse Outfit

	Value
1 B Welding Torch with 5 tips	$17.00
1 Oxygen Reducing Valve with 50 lb. line pressure gauge	10.25
1 Acetylene Reducing Valve with 50 lb. line pressure gauge	11.00
1 Set of Special Welding Hose (20 ft.)	3.00
1 Pair of Welding Glasses	.75
1 Carbon Burning Torch	Free
1 Set Instructions	Free
Net Cost Complete	**$42.00**

If you have a regulator for carbon burning, the oxygen regulator with the outfit is unnecessary, and you can deduct the price ($10.25), from the above total price.

AT WORK

TERMS: 5% discount cash with order or C. O. D. or $20.00 cash with order, balance in two payments, first of $12 in 30 days, $10 in 60 days.

ABOUT TANKS

The two gases used are oxygen and acetylene. The regular automobile lighting cylinders contain acetylene, so you can use them, and oxygen can be bought in loaned cylinders at little cost.

If supplies are desired as well, we will sell for $4.50 additional the following, making you ready for any auto welding:

1 Bottle Aluminum Flux	5 pounds Cast Iron Welding Rods
1 Can Cast Iron Flux	2 pounds Aluminum Welding Rods
1 Can Copper and Brass Flux	2 pounds of Steel Welding Rods
	2 pounds Brass Welding Rods

Weather Does Not Injure Cars Protected With

JOHNSON'S PREPARED WAX

"The Weatherproof Body Polish

Take your car through rain, sun and dust, and bring it out as brilliant and lustrous as when you put the finishing touches on it in the garage. And the reason is that **Johnson's Prepared Wax**

"Sheds Water Like a Duck's Back"

It imparts a hard, dry gloss over the entire body of your car, building up a shining veneer that will not crack or check.
Several coats of **Johnson's Prepared Wax** will revive that appearance of newness, though the varnish on your car may have become rough from wear.
In many cases the timely use of **Johnson's Prepared Wax** saves the expense of having cars revarnished.

Does Not Collect Dust

Johnson's Prepared Wax imparts a perfectly hard, dry, glasslike polish to which the dust cannot adhere. It is quite different from the many oily polishes on the market which gather and hold every speck of dust.
Johnson's Prepared Wax is clean and easy to apply and inexpensive. Increases the value of your car on the market, and gives you the prestige that comes with the appearance of prosperity and class.

One Pint by Parcel Post 60 cents—enough for a season's use.

Send 10c for Sample Can of Johnson's Prepared Wax sufficient for one application on a large car. Agents Wanted.

TAXICAB Companies Demand a Polish That Withstands Dust, Sun, Rain, Mud

This Shaw Taxi Has Traveled Nearly 100,000 Miles in all kinds of weather. It is polished with JOHNSON'S PREPARED WAX. Looks Good as New.

Use Your Car In Any Weather

JOHNSON'S PREPARED WAX

Will Keep It Looking Just Like New

Rain, snow, sleet, wind, dust, sun—and the sizzling heat from the motor fail to affect the hard, dry finish of the car that is polished with JOHNSON'S Prepared Wax.

Does Not Gather Dust

Cleans, polishes and finishes in one operation. Contains neither acid nor oil. Is not sticky and does not collect dust. Taxicab companies—whose stock-in-trade is the appearance of their cars—by using JOHNSON'S Prepared Wax, can keep their limousines looking like new despite the hardest service. JOHNSON'S Prepared Wax practically eliminates refinishing bills. Gives a hard, dry, glass-like finish that will not crack, scratch or check.

Sheds Water Like a Duck's Back

Thousands of car owners, whose cars on the boulevard are their special pride, use JOHNSON'S Prepared Wax regularly for the perpetual impression of newness imparted by the dressing that can not be affected by weather.

Send 10c. for Sample Can of JOHNSON'S Prepared Wax—sufficient for one application on a large car. Use the coupon. Or order 1 pint, sent by Parcel Post, 60c—enough for a season's use.

Vol. 20, No. 2. NEW YORK, OCTOBER, 1915 Monthly, $1.00 per year Single Copy 10 Cents

I have a

Money Making Proposition

for you

limited only by your Efforts

Are you live enough
to know a good thing when you see it?

Are you big enough
to handle a REAL PROPOSITION?

Have you standing
in your community?

Have you the courage
of your convictions?

Have you nerve enough
to back your judgment with your cash?

Have you sand?

We ask the above questions because if you cannot answer "yes" to every one, you are only wasting time by reading further.

If you can qualify and are really BIG ENOUGH to measure up to the standards set by REAL MEN, with REAL BRAINS and REAL ABILITY, we've got the product for you to handle.

We don't want you to buy territory or invest money in our Company.

We've got a straight out and out merchandizing proposition and are marketing an article for which there is a ready demand and an unlimited field.

We back the product up with a liberal guarantee, back the guarantee with a substantial corporation, and back you up with an excellently equipped advertising and sales department.

If you are not a real man, don't bother us by writing. We have no time for broken down financiers, "has beens" or "might have beens." We want real live wires. If you are one, get in touch with us at once.

George L. Schofield, Suite 406-410, 1790 Broadway New York City

Hudson Wins

THE Hudson is a maker of history. It is the one car feared, envied, admired and copied by competitors. It always is ahead. Thousands of buyers wait to see what the Hudson shows before they decide. The Hudson ranks side by side with the costliest cars. It is the only car whose distinctiveness is unaffected by price. Men buy the Hudson because the name guarantees the qualities they seek in a motor-car. They don't ask whether it is a four, a six, an eight or a twelve. *If it's a Hudson it's right.*

Keep your eye on the Hudson

A Mirror-Like Polish

HERE'S something new. Johnson's Cleaner for the hood, fenders and body of your car. Saves repainting and revarnishing. Nothing has ever yet been prepared that equals it. Takes out spots, stains, discolorations and grease in a most amazingly quick and thorough manner. Even those spots that are ground in—one application of Johnson's New Cleaner—presto! they're gone. Surface smooth as new. All ready for *Johnson's Prepared Wax*—a dry, mirror-like, non-dust-collecting finish that *keeps* your car fresh and bright.

Johnson's Cleaner

"The biggest and, believe me, most agreeable surprise about the use of the cleaner," writes Mr. B. F. Swain, "is that I don't have to have my car washed more than once a month. The only polish I used to use collected so much dust that the original finish was all gummed over. No one could polish over such a surface and get results. Cost me at least $1.50 a week heretofore for washings. This cleaner will even take off road oil and it's the only cleaner I ever saw that will do that. The fifty cents I spent for Johnson's New Cleaner and Johnson's Prepared Wax last month alone saved me at least three washings or $4.50.

Send coupon for trial cans of Johnson's New Cleaner and Johnson's Prepared Wax.

Everyone who visits Chicago has seen the famous Yellow Taxicabs. 150 of these cabs have been in service in all kinds of weather for almost a year. They always look as bright as new, due to bring cleaned and polished weekly.

Chief Engineer Geyser, Designer of Chicago's Famous 30-cent Rate Yellow Taxicab, says:

JOHNSON'S PREPARED WAX and JOHNSON'S CLEANER Keep Cars Young!

Johnson's Prepared Wax protects the car finish from snow, sleet, mud, rain and dust—keeps the car always looking like new. It preserves the varnish—prevents checking and discoloring—sheds water and makes a "wash" last twice as long.

Johnson's Cleaner removes spots, stains, scum, surface scratches, mud freckles, accumulations of oil, dust and grime which water will not touch. It doesn't injure or scratch the varnish—simply cleans it and prepares it for a coat of Johnson's Wax.

Send 10c for sample can each of Johnson's Prepared Wax and Johnson's Cleaner—USE THE COUPON

Steer Warms Keep Your Hands Warm While Driving

They make driving a pleasure. On the coldest day they will give out an even high temperature. Steer Warms consist of two neat leather-covered grips, electrically heated, which lace on the steering wheel at any place convenient for driving. They are operated from the storage batteries (or magneto on Ford Cars) and cost nothing to maintain. They are simple, easy to install, durable, and guaranteed for 5 years.

Price { **Standard Gasoline Cars, $7.50. In Canada, $11.00**
Special Ford Type, 5.00. " " 7.25

Dealers: Handle Self-Sellers

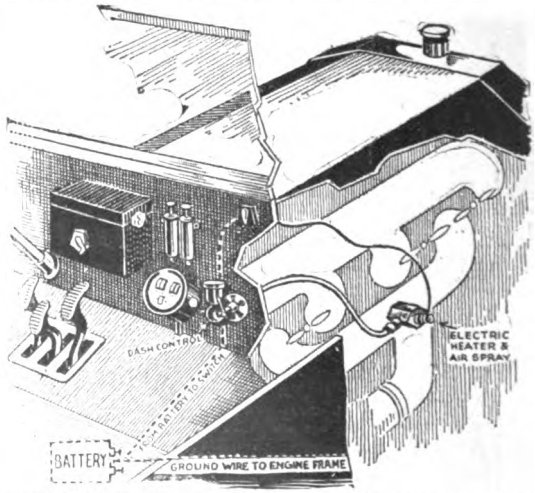
These are positively two of the best accessories that have come out in recent years. They are each useful and serve a definite purpose. They are not simply ornaments or jimcracks that flood the accessory market every year. Any dealer showing Steer Warms or Ieco Manifold Plug will sell them without trouble. This is not a general statement. It is a matter of fact. Thousands of dealers are selling them.

Get your stock now—inquire about our window and show case display cards and other sales helps. Our national advertising campaign is making STEER WARMS and Ieco Manifold Plugs two of the best selling accessories of the cold months. Not an experiment but a tried and proven success.

STARTS CAR QUICK ON COLDEST DAY

THE IECO ELECTRIC MANIFOLD PLUG

This is truly a wonderful plug. Does away with all cranking and trouble in starting your car in zero weather. If you have a self starter it saves using up all your battery in revolving engine many times. The Manifold Plug puts a hot vaporized mixture into the cylinders and the engine goes at once. It will positively start on the coldest day. Furthermore, you do not have to raise the hood—you prime from the seat. Used as an auxiliary air plug it will cut the gasoline bill 20% to 30%. It can be used to remove carbon deposits. This plug is especially adapted for the Ford car and gives wonderful results. It is easy to install, simple, economical and guaranteed for 2 years.



PRICE: FOR ALL CARS, $5.00. IN CANADA, $7.25

Ford cars require 6 Dry Cells. In ordering specify if to be used on storage batteries or dry cells.

The New Shaft Drive Genemotor

Trade Mark

A STARTER AND LIGHTER FOR FORD CARS

A year ago the Genemotor flashed upon the market.

In ninety days it dominated the field.

In eight months it had captured the Gold Medal at the Panama-Pacific International Exposition.

Now here's the 1916 Genemotor—with shaft drive—twelve pounds lighter and a better machine in every way than the Gold Medal Genemotor.

It wipes out chain breakage, noise, hot engines, need of adjustment. No more chain click, wear, or stretch.

Plenty of air circulation around its forward end.

The price of the new Shaft Drive Genemotor remains the same—$75 f.o.b. Lynn, Mass.—but with ten or twenty dollars added in refinement, simplicity and efficiency. The one absolutely last word in Ford car starters is the new Shaft Drive Genemotor.

One of our 10 by 96 foot display signs

MICRO Piston Rings would help you to get more for the money invested in your car.

Money spent in motoring is an investment which you want to keep at a low figure and get the most pleasure from.

Micro Two-Part Pressure-tight Rings substituted for leaky old style rings will save you money and quickly please you by making a permanent service improvement.

You first notice the better compression through quicker get-away, snappier response to throttle and steadier pulling up hills. The saving of gas and oil, by keeping each on the side of the rings on which it does most good, may not be so noticeable, but tests will show this saving to be significant.

The greatest saving and betterment of service, however, result from lessened carbon deposit and consequent coolness of motor, lessened spark plug troubles, absence of smoke in the exhaust, and clean valves, with less frequent regrinding.

Micro Rings remain as tight when old as when new, and being individually cast from very flexible fine-grained gray iron, may be removed any number of times without danger of breakage in refitting.

Here's a typical instance of the benefits from Micro Rings

"I am much pleased with the Micro Rings put into my Ford car last winter to overcome worry, lost compression, excess carbon and waste of oil and gas. In the 9,000 miles I have driven the car since installing the Micro Rings I have used 400 gallons of gas, which gives 22½ miles to the gallon. I have used 15 gallons of oil or 600 miles to the gallon.

"I use the car on a mail route 23 miles long, making an average of 65 stops to the trip, which, of course, uses more gas and oil than a straight run. On October 31, 1915, I made a run of 128 miles on 4 gallons of gas and 1 pint of oil, which, I believe, is a record.

"I have power to spare and the few 8-cylinder cars around here can't do a thing to my Henry Ford on a hill.

"Previously I drove the car 8,000 miles, using two other types of leak tight (?) rings. 600 gallons of gas were required or 13⅓ miles per gallon, and 30 gallons of oil, or 266⅔ miles per gallon. Then I had to remove carbon every 500 or 600 miles, but after putting in Micro Rings, I removed carbon only after 7,500 miles, at which time I removed the pistons to thoroughly clean and tighten the connecting rods. I found the rings in fine shape.

"I couldn't do without Micro Rings now and be satisfied."— W. T. Cobb, La Monte, Mo.

Your judgment in selecting Micro Rings will be more than vindicated on the first installation. Business fairness, extensive manufacturing and rigid inspection to micrometer accuracy put backbone into our guarantee.

If your jobber cannot supply Micro Rings, don't accept a substitute and be disappointed. Write us direct.

Price, each, all standard sizes, $1.50.

Built by Specialists

Motor truck building is our sole business. We make nothing else. We specialize on Service Standardized Trucks. For over 5 years, our entire time, thought and attention have been devoted to it.

In addition, every unit in the building of Service Trucks is built by a specialist.

Read this list of reputable unit makers, who contribute their engineering genius and manufacturing efficiency to standardize the Service Truck.

These units represent the utmost in their field. Each unit is the leader in its class. Each dominates in its respective market. Each has stood the test of time in actual use under all conditions. And each has proved its superiority and maintained its supremacy.

Imagine the best unit makers in the country uniting in their skill to create a Motor Truck, then you will get a splendid idea of the quality, efficiency and reliability of the wonderful Service Motor Truck.

Service Standardized TRUCKS

Worm Drive

1—1½—2—3½—5 Ton Models

In designing and building Service Trucks, we go farther for quality than any one maker of Standard units. Our demands average

20% Above Standard

Because every unit is oversized—beyond the maximum requirements needed for proper performance of each Service Truck in actual use. This 20% greater than standard is a margin of safety that forestalls trouble. In a Service Standardized Truck there is always more strength — more power — more flexibility than needed. That's why there are no disappointed Service owners.

Double Guarantee

That's another distinct advantage Service users receive. Every Service Standardized Truck is guaranteed both by us and the unit makers.

Each manufacturer of a Service Standard Unit is concerned and vitally interested in seeing that each Service owner gets full satisfaction. Service Standardized Trucks are backed both by us and the unit maker. It's a double guarantee—a positive assurance of 100% service.

Any Type Body

Service Standardized Trucks are equipped with any type of body for any kind of haulage. Service represents a complete line for every commercial need.

Whenever desired we build to order special bodies to meet any particular requirement.

Catalog for Truck Users

Truck users who are in the market for one or more trucks, write to us for Service Catalog—investigate the Service Standardized Truck and learn the whole Service story.

Attractive Offer to Dealers

We are in a position to offer to responsible dealers—who measure up to our standard—in territory where Service is not now represented, a very attractive proposition. Let us send you details and our complete new catalog *Write today.*

JOHNSON'S PREPARED WAX

Keeps Cars Like New

More JOHNSON'S Prepared Wax was used in 1915 than all other makes of automobile polish **combined.**

JOHNSON'S Prepared Wax is the STANDARD automobile polish—the only polish recommended by the makers of the world's finest cars.

Imparts a hard, dry, lasting polish — does not gather dust—sheds water like a duck's back — makes a wash last twice as long—preserves as well as protects the varnish—saves costly refinishing bills —positively harmless.

S. C. JOHNSON & SON, Racine, Wis. A.D.-2.

I enclose 10c. for a sample can each of Johnson's Prepared Wax and Johnson's Cleaner—sufficient for cleaning and polishing a large car.
